RCA RECEIVING TUBE MANUAL
Technical Series RC-19

ELECTRON TUBE DIVISION
RADIO CORPORATION of AMERICA
HARRISON, NEW JERSEY
RCA Receiving Tube
MANUAL

THIS MANUAL like its preceding editions has been prepared to assist those who work or experiment with electron tubes and circuits. It will be found valuable by engineers, service technicians, experimenters, students, radio amateurs, and all others technically interested in electron tubes.

The material in this edition has been augmented and revised to keep abreast of the technological advances in electronic fields. Many tube types widely used in the design of new electronic equipment prior to 1950 are now chiefly of renewal interest; in their place, new advanced types are being used. Consequently, in the Tube Types Section, the presentation on the older types has been limited to essential basic data while detailed information has been given on the newer more important types.

In addition to the tube types for home-entertainment use covered in this Manual, the ELECTRON TUBE DIVISION of RADIO CORPORATION OF AMERICA offers other small receiving-type tubes for industrial and specialized applications, such as the “Special Red” tubes, premium tubes, computer tubes, voltage regulators, acorn tubes, and pencil tubes. Other lines of RCA electron devices include:

POWER TUBES
Transmitting and
Industrial Types

TELEVISION CAMERA TUBES
Iconoscopes, Monoscopes,
Vidicons, and Image Orthicons

PHOTOTUBES
Single-Unit, Twin-Unit,
and Multiplier Types

PHOTOCELLS
Photoconductive and
Photojunction Types

CATHODE-RAY TUBES
Special-Purpose
Kinescopes, Storage Tubes
and Oscillograph Types

THYRATRONS & IGNITRONS
SPECIAL TYPES
Vacuum-Gauge Tubes,
Magnetrons, and
Traveling-Wave Tubes

SEMICONDUCTOR DEVICES
Transistors and
Silicon Rectifiers

The Parts of a Miniature Pentode
The electron tube is a marvelous device. It makes possible the performing of operations, amazing in conception, with a precision and a certainty that are astounding. It is an exceedingly sensitive and accurate instrument—the product of coordinated efforts of engineers and craftsmen. Its construction requires materials from every corner of the earth. Its use is world-wide. Its future possibilities, even in the light of present-day accomplishments, are but dimly foreseen; for each development opens new fields of design and application.

The importance of the electron tube lies in its ability to control almost instantly the flight of the millions of electrons supplied by the cathode. It accomplishes this control with a minimum of energy. Because it is almost instantaneous in its action, the electron tube can operate efficiently and accurately at electrical frequencies much higher than those attainable with rotating machines.

Electrons

All matter exists in the solid, liquid, or gaseous state. These three forms consist entirely of minute divisions known as molecules, which, in turn, are composed of atoms. Atoms have a nucleus which is a positive charge of electricity, around which revolve tiny charges of negative electricity known as electrons. Scientists have estimated that electrons weigh only 1/30-billion, billion, billion, billionths of an ounce, and that they may travel at speeds of thousands of miles per second.

Electron movement may be accelerated by the addition of energy. Heat is one form of energy which can be conveniently used to speed up the electron. For example, if the temperature of a metal is gradually raised, the electrons in the metal gain velocity. When the metal becomes hot enough, some electrons may acquire sufficient speed to break away from the surface of the metal. This action, which is accelerated when the metal is heated in a vacuum, is utilized in most electron tubes to produce the necessary electron supply.

An electron tube consists of a cathode, which supplies electrons, and one or more additional electrodes, which control and collect these electrons, mounted in an evacuated envelope. The envelope may be made of glass, metal, ceramic, or a combination of these materials.

Cathodes

A cathode is an essential part of an electron tube because it supplies the electrons necessary for tube operation. When energy in some form is applied to the cathode, electrons are released. Heat is the form of energy generally used. The method of heating the cathode may be used to distinguish between the different forms of cathodes. For example, a directly heated cathode, or filament-cathode, is a wire heated by the passage of an electric current. An indirectly heated cathode, or heater-cathode, consists of a filament, or heater, enclosed in a metal sleeve. The sleeve carries the electron-emitting material on its outside surface and is heated by radiation and conduction from the heater.

A filament, or directly heated cathode, such as that shown in Fig. 1 may be further classified by identifying the filament or electron-emitting material. The materials in regular use are tungsten, thoriated tungsten, and metals which have been coated with alkaline-earth oxides. Tungsten filaments are made from the pure metal. Because they must operate at high temperatures (a
dazzling white) to emit sufficient electrons, a relatively large amount of filament power is required.

Thoriated-tungsten filaments are made from tungsten impregnated with thorium oxide. Due to the presence of thorium, these filaments liberate electrons at a more moderate temperature of about 1700°C (a bright yellow) and are, therefore, much more economical of filament power than are pure tungsten filaments.

Alkaline earths are usually applied as a coating on a nickel-alloy wire or ribbon. This coating, which is dried in a relatively thick layer on the filament, requires only a relatively low temperature of about 700-750°C (a dull red) to produce a copious supply of electrons. Coated filaments operate very efficiently and require relatively little filament power. However, each of these cathode materials has special advantages which determine the choice for a particular application.

![Diagram](image)

**Fig. 1**

**Fig. 2**

Directly heated filament-cathodes require comparatively little heating power. They are used in almost all of the tube types designed for battery operation because it is, of course, desirable to impose as small a drain as possible on the batteries. Examples of battery-operated filament types are the 1R5, 1U4, 1U5, and 3V4. AC-operated types having directly heated filament-cathodes include the 2A3 and 5Y3-GT.

An indirectly heated cathode, or heater-cathode, consists of a thin metal sleeve coated with electron-emitting material such as alkaline-earth oxides. Within the sleeve is a heater which is insulated from the sleeve, as shown in Fig. 2. The heater is made of tungsten or tungsten-alloy wire and is used only for the purpose of heating the cathode sleeve and sleeve coating to an electron-emitting temperature. Useful emission does not take place from the heater wire.

The heater-cathode construction is well adapted for use in electron tubes intended for operation from ac power lines and from storage batteries. The use of separate parts for emitter and heater functions, the electrical insulation of the heater from the emitter, and the shielding effect of the sleeve may all be utilized in the design of the tube to minimize the introduction of hum from the ac heater supply and to minimize electrical interference which might enter the tube circuit through the heater-supply line. From the viewpoint of circuit design, the heater-cathode construction offers advantages in connection flexibility because of the electrical separation of the heater from the cathode.

Another advantage of the heater-cathode construction is that it makes practical the design of a rectifier tube having close spacing between its cathode and plate, and of an amplifier tube having close spacing between its cathode and grid. In a close-spaced rectifier tube, the voltage drop in the tube is low, and, therefore, the regulation is improved. In an amplifier tube, the close spacing increases the gain obtainable from the tube. Because of the advantages of the heater-cathode construction, almost all present-day receiving tubes designed for ac operation have heater-cathodes.

**Generic Tube Types**

Electrons are of no value in an electron tube unless they can be put to work. Therefore, a tube is designed with the parts necessary to utilize electrons as well as those required to produce them. These parts consist of a cathode and one or more supplementary electrodes. The electrodes are enclosed in an evacuated envelope having the necessary connections brought out through air-tight seals. The air is removed from the envelope to allow free movement of the electrons and to prevent injury to the emitting surface of the cathode.

When the cathode is heated, electrons leave the cathode surface and form an invisible cloud in the space around it. Any positive electric potential within the evacuated envelope offers a strong
attraction to the electrons (unlike electric charges attract; like charges repel). Such a positive electric potential can be supplied by an anode (positive electrode) located within the tube in proximity to the cathode.

**Diodes**

The simplest form of electron tube contains two electrodes, a cathode and an anode (plate), and is often called a diode, the family name for a two-electrode tube. In a diode, the positive potential is supplied by a suitable electrical source connected between the plate terminal and a cathode terminal, as shown in Fig. 3. Under the influence of the positive plate potential, electrons flow from the cathode to the plate and return through the external plate-battery circuit to the cathode, thus completing the circuit. This flow of electrons is known as the *plate current*.

If a negative potential is applied to the plate, the free electrons in the space surrounding the cathode will be forced back to the cathode and no plate current will flow. If an alternating voltage is applied to the plate, the plate is alternately made positive and negative. Because plate current flows only during the time when the plate is positive, current flows through the tube in only one direction and is said to be rectified. Fig. 4 shows the rectified output current produced by an alternating input voltage.

Diode rectifiers are used in ac receivers to convert the ac supply voltage to dc voltage for the electrodes of the other tubes in the receiver. Rectifier tubes having only one plate and one cathode, such as the 35W4, are called *half-wave rectifiers*, because current can flow only during one-half of the alternating-current cycle. When two plates and one or more cathodes are used in the same tube, current may be obtained on both halves of the ac cycle. The 6X4, 5Y3-GT, and 5U4-GB are examples of this type and are called *full-wave rectifiers*.

Not all of the electrons emitted by the cathode reach the plate. Some return to the cathode while others remain in the space between the cathode and plate for a brief period to produce an effect known as *space-charge*. This charge has a repelling action on other electrons which leave the cathode surface and impedes their passage to the plate. The extent of this action and the amount of space-charge depend on the cathode temperature, the distance between the cathode and the plate, and the plate potential. The higher the plate potential, the less is the tendency for electrons to remain in the space-charge region and repel other electrons. This effect may be noted by applying increasingly higher plate voltages to a tube operating at a fixed heater or filament voltage. Under these conditions, the maximum number of available electrons is fixed, but increasingly higher plate voltages will succeed in attracting a greater proportion of the free electrons.

Beyond a certain plate voltage, however, additional plate voltage has little effect in increasing the plate current because all of the electrons emitted by the cathode are already being drawn to the plate. This maximum current, illustrated in Fig. 5, is called *saturation current*. Because it is an indication of the total number of electrons emitted, it is also known as *emission current* or simply *emission*.

Although tubes are sometimes tested
by measurement of their emission current, it is generally not advisable to measure the full value of emission because this value would be sufficiently large to cause change in the tube's characteristics or even to damage the tube. Consequently, while the test value of emission current is somewhat larger than the maximum current which will be required from the cathode in the use of the tube, it is ordinarily less than the full emission current. The emission test, therefore, is used to indicate whether the cathode can supply a sufficient number of electrons for satisfactory operation of the tube.

If space charge were not present to repel electrons coming from the cathode, the same plate current could be produced at a lower plate voltage. One way to make the effect of space charge small is to make the distance between plate and cathode small. This method is used in rectifier types having heater-cathodes, such as the 5V4-GA and the 6AX5-GT. In these types the radial distance between cathode and plate is only about two hundredths of an inch.

Another method of reducing space-charge effect is utilized in mercury-vapor rectifier tubes. When such tubes are operated, a small amount of mercury contained in the tube is partially vaporized, filling the space inside the bulb with mercury atoms. These atoms are bombarded by electrons on their way to the plate. If the electrons are moving at a sufficiently high speed, the collisions tear off electrons from the mercury atoms. The mercury atom is then said to be "ionized," i.e., it has lost one or more electrons and, therefore, has a positive charge. Ionization is evidenced by a bluish-green glow between the cathode and plate. When ionization occurs, the space charge is neutralized by the positive mercury atoms so that increased numbers of electrons are made available. Mercury-vapor tubes are used primarily for power rectifiers.

**Ionic-heated-cathode rectifier tubes**, such as the 0Z4 and 0Z4-G, also depend on gas ionization for their operation. These tubes are of the full-wave design and contain two anodes and a coated cathode sealed in a bulb containing a reduced pressure of inert gas. The cathode in each of these types becomes hot during tube operation, but the heating effect is caused by bombardment of the cathode by ions within the tube rather than by heater or filament current from an external source.

The internal structure of an ionic-heated-cathode tube is designed so that when sufficient voltage is applied to the tube, ionization of the gas occurs between the anode which is instantaneously positive and the cathode. Under normal operating voltages, ionization does not take place between the anode that is negative and the cathode so that the requirements for rectification are satisfied. The initial small flow of current through the tube is sufficient to raise the cathode temperature quickly to incandescence whereupon the cathode emits electrons. The voltage drop in such tubes is slightly higher than that of the usual hot-cathode gas rectifiers because energy is taken from the ionization discharge to keep the cathode at operating temperature. Proper operation of these rectifiers requires a minimum flow of load current at all times in order to maintain the cathode at the temperature required to supply sufficient emission.

**Triodes**

When a third electrode, called the grid, is placed between the cathode and plate, the tube is known as a triode, the family name for a three-electrode tube. The grid usually consists of relatively fine wire wound on two support rods and extending the length of the cathode. The spaces between turns are comparatively large so that the passage of electrons from cathode to plate is practically unobstructed by the grid wires. The pur-
pose of the grid is to control the flow of plate current. When a tube is used as an amplifier, a negative dc voltage is usually applied to the grid. Under this condition the grid does not draw appreciable current.

The number of electrons attracted to the plate depends on the combined effect of the grid and plate polarities, as shown in Fig. 6. When the plate is positive, as is normal, and the dc grid voltage is made more and more negative, the plate is less able to attract electrons to it and plate current decreases. When the grid is made less and less negative (more and more positive), the plate more readily attracts electrons to it and plate current increases. Hence, when the voltage on the grid is varied in accordance with a signal, the plate current varies with the signal. Because a small voltage applied to the grid can control a comparatively large amount of plate current, the signal is amplified by the tube. Typical three-electrode tube types are the 6C4 and 6AF4-A.

The grid, plate, and cathode of a triode form an electrostatic system, each electrode acting as one plate of a small capacitor. The capacitances are those existing between grid and plate, plate and cathode, and grid and cathode.

These capacitances are known as inter-electrode capacitances. Generally, the capacitance between grid and plate is of the most importance. In high-gain radio-frequency amplifier circuits, this capacitance may act to produce undesired coupling between the input circuit, the circuit between grid and cathode, and the output circuit, the circuit between plate and cathode. This coupling is undesirable in an amplifier because it may cause instability and unsatisfactory performance.

Tetrodes

The capacitance between grid and plate can be made small by mounting an additional electrode, called the screen grid (grid No. 2), in the tube. With the addition of the grid No. 2, the tube has four electrodes and is, accordingly, called a tetrode. The screen grid or grid No. 2 is mounted between the grid No. 1 (control grid) and the plate, as shown in Fig. 7, and acts as an electrostatic shield between them, thus reducing the grid-to-plate capacitance. The effectiveness of this shielding action is increased by a bypass capacitor connected between screen grid and cathode. By means of the screen grid and this bypass capacitor, the grid-plate capacitance of a tetrode is made very small. In practice, the grid-plate capacitance is reduced from several micromicrofarads ($\mu$F) for a triode to 0.01 $\mu$F or less for a screen-grid tube.

The screen grid has another desirable effect in that it makes plate current practically independent of plate voltage over a certain range. The screen grid is operated at a positive voltage and, therefore, attracts electrons from the cathode. However, because of the comparatively large space between wires of the screen grid, most of the electrons drawn to the screen grid pass through it to the plate. Hence the screen grid supplies an electrostatic force pulling electrons from the cathode to the plate. At the same time the screen grid shields the electrons between cathode and screen grid from the plate so that the plate experts very little electrostatic force on electrons near the cathode.

So long as the plate voltage is higher than the screen-grid voltage, plate current in a screen-grid tube depends to a great degree on the screen-grid voltage and very little on the plate voltage. The fact that plate current in a screen-grid
tube is largely independent of plate voltage makes it possible to obtain much higher amplification with a tetrode than with a triode. The low grid-plate capacitance makes it possible to obtain this high amplification without plate-to-grid feedback and resultant instability. In receiving-tube applications, the tetrode has been replaced to a considerable degree by the pentode.

**Pentodes**

In all electron tubes, electrons striking the plate may, if moving at sufficient speed, dislodge other electrons. In two- and three-electrode types, these dislodged electrons usually do not cause trouble because no positive electrode other than the plate itself is present to attract them. These electrons, therefore, are drawn back to the plate. Emission caused by bombardment of an electrode by electrons from the cathode is called secondary emission because the effect is secondary to the original cathode emission.

In the case of screen-grid tubes, the proximity of the positive screen grid to the plate offers a strong attraction to these secondary electrons and particularly so if the plate voltage swings lower than the screen-grid voltage. This effect lowers the plate current and limits the useful plate-voltage swing for tetrodes.

The effects of secondary emission are minimized when a fifth electrode is placed within the tube between the screen grid and plate. This fifth electrode is known as the suppressor grid (grid No.3) and is usually connected to the cathode, as shown in Fig. 8. Because of

![Diagram of electronic components](image)

its negative potential with respect to the plate, the suppressor grid retards the flight of secondary electrons and diverts them back to the plate.

The family name for a five-electrode tube is "pentode". In power-output pentodes, the suppressor grid makes possible higher power output with lower grid-driving voltage; in radio-frequency amplifier pentodes the suppressor grid makes possible high voltage amplification at moderate values of plate voltage. These desirable features result from the fact that the plate-voltage swing can be made very large. In fact, the plate voltage may be as low as, or lower than, the screen-grid voltage without serious loss in signal-gain capability. Representative pentodes used for power amplification are the 8V4 and 6K6-GT; representative pentodes used for voltage amplification are the 1U4, 6AU6, 12SK7, and 6BA6.

**Beam Power Tubes**

A beam power tube is a tetrode or pentode in which directed electron beams are used to increase substantially the power-handling capability of the tube. Such a tube contains a cathode, a control grid (grid No.1), a screen grid (grid No.2), a plate, and, optionally, a suppressor grid (grid No.3). When a beam power tube is designed without an actual suppressor grid, the electrodes are so spaced that secondary emission from the plate is suppressed by space-charge effects between screen grid and plate. The space charge is produced by the slowing up of electrons traveling from a high-potential screen grid to a lower-potential plate. In this low-velocity region, the space charge produced is sufficient to repel secondary electrons emitted from the plate and to cause them to return to the plate.

Beam power tubes of this design employ beam-confining electrodes at cathode potential to assist in producing the desired beam effects and to prevent stray electrons from the plate from returning to the screen grid outside of the beam. A feature of a beam power tube is its low screen-grid current. The screen grid and the control grid are spiral wires wound so that each turn of the screen grid is shaded from the cathode by a grid turn. This alignment of the screen grid and control grid causes the electrons to travel in sheets between the turns of the screen grid so that very few of them strike the screen grid. Because of the
effective suppressor action provided by space charge and because of the low current drawn by the screen grid, the beam power tube has the advantages of high power output, high power sensitivity, and high efficiency.

Fig. 9 shows the structure of a beam power tube employing space-charge suppression and illustrates how the electrons are confined to beams. The beam condition illustrated is that for a plate potential less than the screen-grid potential. The high-density space-charge region is indicated by the heavily dashed lines in the beam. Note that the edges of the beam-confining electrodes coincide with the dashed portion of the beam. In this way the space-charge potential region is extended beyond the beam boundaries and stray secondary electrons are prevented from returning to the screen grid outside of the beam. The space-charge effect may also be obtained by use of an actual suppressor grid. Examples of beam power tubes are 6AQ5-A, 6L6-GB, 6V6-GT, and 50C5.

Multi-Electrode and Multi-Unit Tubes

Early in the history of tube development and application, tubes were designed for general service; that is, a single tube type—a triode—was used as a radio-frequency amplifier, an intermediate-frequency amplifier, an audio-frequency amplifier, an oscillator, or a detector. Obviously, with this diversity of application, one tube did not meet all requirements to the best advantage.

Later and present trends of tube design are the development of "specialty" types. These types are intended either to give optimum performance in a particular application or to combine in one bulb functions which formerly required two or more tubes. The first class of tubes includes such examples of specialty types as the 6CB6 and 6BY6. Types of this class generally require more than three electrodes to obtain the desired special characteristics and may be broadly classed as multi-electrode types. The 6BY6 is an especially interesting type in this class. This tube has an unusually large number of electrodes, namely seven, exclusive of the heater. Plate current in the tube is varied at two different frequencies at the same time. The tube is designed primarily for use as a combined sync separator and sync clipper in television receivers.

The second class includes multi-unit tubes such as the twin-diode triodes 6BF6 and 6AV6, as well as triode-pentodes such as the 6U8-A and 6X8. This class also includes class A twin triodes such as the 6CG7 and 12AX7, and types such as the 6CM7 containing dissimilar triode units used primarily as combined vertical oscillators and vertical deflection amplifiers in television receivers. Full-wave rectifiers are also multi-unit types.

A third class of tubes combines features of each of the other two classes. Typical of this third class are the pentagrid-converter types 1R5, 6BE6, and 6SA7. These tubes are similar to the multi-electrode types in that they have seven electrodes, all of which affect the electron stream; and they are similar to the multi-unit tubes in that they perform simultaneously the double function of oscillator and mixer in superheterodyne receivers.

Television Picture Tubes

The picture tube, or kinescope, is a multi-electrode tube used principally in television receivers for picture display. It consists essentially of an electron gun, a glass or metal-and-glass envelope and face-plate combination, and a fluorescent screen.

The electron gun includes a cathode for the production of free electrons, one
or more control electrodes for accelerating the electrons in the beam, and, optionally, a device for "trapping" unwanted ions out of the electron beam.

Focusing of the beam is accomplished either electromagnetically by means of a focusing coil placed on the neck of the tube, or electrostatically, as shown in Fig. 10, by means of focusing electrodes ( grids No. 4 and No. 5) within the envelope of the tube. The screen is a white-fluorescing phosphor P4 of either the silicate or the sulfide type.

Deflection of the beam is accomplished either electrostatically by means of deflecting electrodes within the envelope of the tube, or electromagnetically by means of a deflecting yoke placed on the neck of the tube. Fig. 10 shows the structure of the gun section of a picture tube and illustrates how the electron beam is formed, how the ions are separated from the electron beam by means of the tilted-gun and ion-trap-magnet arrangement, and how the beam is deflected by means of an electromagnetic deflecting yoke.

The color kinescope 21CYP22 consists of three electron guns and an aluminized, tricolor, phosphor-dot screen on the inner surface of the spherical filterglass faceplate. It utilizes magnetic convergence, electrostatic focus, and magnetic deflection.
The term “characteristics” is used to identify the distinguishing electrical features and values of an electron tube. These values may be shown in curve form or they may be tabulated. When the characteristics values are given in curve form, the curves may be used for the determination of tube performance and the calculation of additional tube factors.

Tube characteristics are obtained from electrical measurements of a tube in various circuits under certain definite conditions of voltages. Characteristics may be further described by denoting the conditions of measurements. For example Static Characteristics are the values obtained with different dc potentials applied to the tube electrodes, while Dynamic Characteristics are the values obtained with an ac voltage on a control grid under various conditions of dc potentials on the electrodes. The dynamic characteristics, therefore, are indicative of the performance capabilities of a tube under actual working conditions.

Static characteristics may be shown by plate characteristics curves and transfer (mutual) characteristics curves. These curves present the same information, but in two different forms to increase its usefulness. The plate characteristic curve is obtained by varying plate voltage and measuring plate current for different grid bias voltages, while the transfer-characteristic curve is obtained by varying grid bias voltage and measuring plate current for different plate voltages. A plate-characteristic family of curves is illustrated by Fig. 11. Fig. 12 gives the transfer-characteristic family of curves for the same tube.

Dynamic characteristics include amplification factor, plate resistance, control-grid—plate transconductance, and certain detector characteristics, and may be shown in curve form for variations in tube operating conditions.

The amplification factor, or $\mu$, is the ratio of the change in plate voltage to a change in control-electrode voltage in the opposite direction, under the condition that the plate current remains unchanged and that all other electrode voltages are maintained constant. For example, if, when the plate voltage is made 1 volt more positive, the control-electrode (grid-No.1) voltage must be made 0.1 volt more negative to hold plate current unchanged, the amplification factor is 1 divided by 0.1, or 10. In other words, a small voltage variation in the grid circuit of a tube has the same effect on the plate current as a large plate-voltage change—the latter equal to the product of the grid-voltage change and amplification factor. The $\mu$ of a tube is often useful for calculating stage gain. This use is discussed in the ELECTRON TUBE APPLICATIONS SECTION.

Plate resistance ($r_p$) of an electron tube is the resistance of the path between cathode and plate to the flow of alternating current. It is the quotient of a small change in plate voltage divided by the corresponding change in plate current and is expressed in ohms, the unit of resistance. Thus, if a change of 0.1 milliamperes (0.0001 amperes) is produced by a plate voltage variation of 1 volt, the plate resistance is 1 divided by 0.0001, or 10000 ohms.
Control-grid—plate transconductance, or simply transconductance \((g_m)\), is a factor which combines in one term the amplification factor and the plate resistance, and is the quotient of the first divided by the second. This term has also been known as mutual conductance. Transconductance may be more strictly defined as the quotient of a small change in plate current (amperes) divided by the small change in the control-grid voltage producing it, under the condition that all other voltages remain unchanged. Thus, if a grid-voltage change of 0.5 volt causes a plate-current change of 1 milliampere (0.001 ampere), with all other voltages constant, the transconductance is 0.001 divided by 0.5, or 0.002 mho. A "mho" is the unit of conductance and was named by spelling ohm backwards. For convenience, a millioint of a mho, or a micromho \((\mu \text{mho})\), is used to express transconductance. Thus, in the example, 0.002 mho is 2000 micromhos.

Conversion transconductance \((g_c)\) is a characteristic associated with the mixer (first detector) function of tubes and may be defined as the quotient of the intermediate-frequency (if) current in the primary of the if transformer divided by the applied radio-frequency (rf) voltage producing it; or more precisely, it is the limiting value of this quotient as the rf voltage and if current approach zero. When the performance of a frequency converter is determined, conversion transconductance is used in the same way as control-grid—plate transconductance is used in single-frequency amplifier computations.

The plate efficiency of a power amplifier tube is the ratio of the ac power output \((P_o)\) to the product of the average dc plate voltage \((E_b)\) and dc plate current \((I_b)\) at full signal, or

\[
\text{Plate efficiency} = \frac{P_o \text{ watts}}{E_b \text{ volts} \times I_b \text{ amperes}} \times 100
\]

The power sensitivity of a tube is the ratio of the power output to the square of the input signal voltage \((E_{in})\) and is expressed in mhos as follows:

\[
\text{Power sensitivity (mhos)} = \frac{P_o \text{ watts}}{(E_{in, \text{rms}})^2}
\]
Electron Tube Applications

The diversified applications of an electron receiving tube have, within the scope of this section, been treated under seven headings. These are: Amplification, Rectification, Detection, Automatic Volume or Gain Control, Oscillation, Frequency Conversion, and Automatic Frequency Control. Although these operations may take place at either radio or audio frequencies and may involve the use of different circuits and different supplemental parts, the general considerations of each kind of operation are basic.

Amplification

The amplifying action of an electron tube was mentioned under Triodes in the section on ELECTRONS, ELECTRODES, and ELECTRON TUBES. This action can be utilized in electronic circuits in a number of ways, depending upon the results desired. Four classes of amplifier service recognized by engineers are covered by definitions standardized by the Institute of Radio Engineers. This classification depends primarily on the fraction of input cycle during which plate current is expected to flow under rated full-load conditions. The classes are class A, class AB, class B, and class C. The term “cutoff bias” used in these definitions is the value of grid bias at which plate current is some very small value.

Classes of Service

A class A amplifier is an amplifier in which the grid bias and alternating grid voltages are such that plate current in a specific tube flows at all times.

A class AB amplifier is an amplifier in which the grid bias and alternating grid voltages are such that plate current in a specific tube flows for appreciably more than half but less than the entire electrical cycle.

A class B amplifier is an amplifier in which the grid bias is approximately equal to the cutoff value, so that the plate current is approximately zero when no exciting grid voltage is applied, and so that plate current in a specific tube flows for approximately one-half of each cycle when an alternating grid voltage is applied.

A class C amplifier is an amplifier in which the grid bias is appreciably greater than the cutoff value, so that the plate current in each tube is zero when no alternating grid voltage is applied, and so that plate current flows in a specific tube for appreciably less than one-half of each cycle when an alternating grid voltage is applied.

The suffix 1 may be added to the letter or letters of the class identification to denote that grid current does not flow during any part of the input cycle. The suffix 2 may be used to denote that grid current flows during some part of the cycle.

For radio-frequency (rf) amplifiers which operate into a selective tuned circuit, as in radio transmitter applications, or under requirements where distortion is not an important factor, any of the above classes of amplifiers may be used, either with a single tube or a push-pull stage. For audio-frequency (af) amplifiers in which distortion is an important factor, only class A amplifiers permit single-tube operation. In this case, operating conditions are usually chosen so that distortion is kept below the conventional 5 per cent for triodes and the conventional 7 to 10 per cent for tetrodes or pentodes. Distortion can be reduced below these figures by means of special circuit arrangements such as that discussed under inverse feedback. With class A amplifiers, reduced distortion with improved power performance can be obtained by using a push-pull stage for audio service. With class AB and class B amplifiers, a balanced amplifier stage using two tubes is required for audio service.

Class A Voltage Amplifiers

As a class A voltage amplifier, an electron tube is used to reproduce grid-voltage variations across an impedance or a resistance in the plate circuit. These variations are essentially of the same form as the input signal voltage impressed on the grid, but their amplitude
is increased. This increase is accomplished by operation of the tube at a suitable grid bias so that the applied grid input voltage produces plate-current variations proportional to the signal swings. Because the voltage variation obtained in the plate circuit is much larger than that required to swing the grid, amplification of the signal is obtained.

Fig. 13 gives a graphical illustration of this method of amplification and shows, by means of the grid-voltage vs. plate-current characteristics curve, the effect of an input signal (S) applied to the grid of a tube. The output signal (O) is the resulting amplified plate-current variation.

The plate current flowing through the load resistance (R) of Fig. 14 causes a voltage drop which varies directly with the plate current. The ratio of this voltage variation produced in the load resistance to the input signal voltage is the voltage amplification, or gain, provided by the tube. The voltage amplification due to the tube is expressed by the following convenient formulas:

\[
\text{Voltage amplification} = \frac{\mu \times R_L}{R_L + r_p}
\]

or

\[
\frac{g_m \times r_p \times R_L}{1000000 \times (r_p + R_L)}
\]

where \(\mu\) is the amplification factor of the tube, \(R_L\) is the load resistance in ohms, \(r_p\) is the plate resistance in ohms, and \(g_m\) is the transconductance in micromhos.

From the first formula, it can be seen that the gain actually obtainable from the tube is less than the tube’s amplification factor but that the gain approaches the amplification factor when the load resistance is large compared to the tube’s plate resistance. Fig. 15 shows graphically how the gain approaches the amplification factor of the tube as the load resistance is increased. From the curve it can be seen that a high value of load resistance should be used to obtain high gain in a voltage amplifier.

In a resistance-coupled amplifier, the load resistance of the tube is approximately equal to the resistance of the plate resistor in parallel with the grid resistor of the following stage. Hence, to obtain a large value of load resistance, it is necessary to use a plate resistor and a grid resistor of large resistance. However, the plate resistor should not be too large because the flow of plate current through the plate resistor produces a voltage drop which reduces the plate voltage applied to the tube. If the plate resistor is too large, this drop will be too large, the plate voltage on the tube will be too small, and the voltage output of the tube will be too small. Also, the grid resistor of the following stage should not be too large, the actual maximum value being dependent on the particular tube type. This precaution is necessary because all tubes contain minute amounts of residual gas which cause a minute flow of current through the grid resistor. If the grid resistor is too large, the positive bias developed by the flow of this current through the resistor decreases the normal negative bias and produces an increase in the plate current. This increased current may overheat the tube and cause liberation of more gas which, in turn, will cause further decrease in bias. The action is cumulative and results in a runaway condition which can destroy the tube.

A higher value of grid resistance is permissible when cathode-resistor bias is used than when fixed bias is used. When cathode-resistor bias is used, a loss in bias due to gas or grid-emission
effects is almost completely offset by an increase in bias due to the voltage drop across the cathode resistor. Typical values of plate resistor and grid resistor for tube types used in resistance-coupled circuits, and the values of gain obtainable, are shown in the RESISTANCE-COUPLED AMPLIFIER SECTION.

The input impedance of an electron tube (that is, the impedance between grid and cathode) consists of (1) a reactive component due to the capacitance between grid and cathode, (2) a resistive component resulting from the time of transit of electrons between cathode and grid, and (3) a resistive component developed by the part of the cathode lead inductance which is common to both the input and output circuits. Components (2) and (3) are dependent on the frequency of the incoming signal. The input impedance is very high at audio frequencies when a tube is operated with its grid biased negative. In a class A or AB₁ transformer-coupled audio amplifier, therefore, the loading imposed by the grid on the input transformer is negligible. As a result, the secondary impedance of a class A₁ or class AB₁ input transformer can be made very high because the choice is not limited by the input impedance of the tube; however, transformer design considerations may limit the choice.

At the higher radio frequencies, the input impedance may become very low even when the grid is negative, due to the finite time of passage of electrons between cathode and grid and to the appreciable lead reactance. This impedance drops very rapidly as the frequency is raised, and increases input-circuit loading. In fact, the input impedance may become low enough at very high radio frequencies to affect appreciably the gain and selectivity of a preceding stage. Tubes such as the "acorn" and "pencil" types and the high-frequency miniatures have been developed to have low input capacitances, low electron-transit time, and low lead inductance so that their input impedance is high even at the ultra-high radio frequencies. Input admittance is the reciprocal of input impedance.

A remote-cutoff amplifier tube is a modified construction of a pentode or a tetrode type designed to reduce modulation-distortion and cross-modulation in radio-frequency stages. Cross-modulation is the effect produced in a radio or television receiver by an interfering station "riding through" on the carrier of the station to which the receiver is tuned. Modulation-distortion is a distortion of the modulated carrier and appears as audio-frequency distortion in the output. This effect is produced by a radio-frequency amplifier stage operating on an excessively curved characteristic when the grid bias has been increased to reduce volume. The offending stage for cross-modulation is usually the first radio-frequency amplifier, while for modulation-distortion the cause is usually the last intermediate-frequency stage. The characteristics of remote-cutoff types are such as to enable them to handle both large and small input signals with minimum distortion over a wide range of signal strength.

Fig. 16 illustrates the construction of the grid No.1 (control grid) in a remote-cutoff tube. The remote-cutoff action is due to the structure of the grid which provides a variation in amplification factor with change in grid bias. The grid No.1 is wound with open spacing at
the middle and with close spacing at the ends. When weak signals and low grid bias are applied to the tube, the effect of the non-uniform turn spacing of the grid on cathode emission and tube characteristics is essentially the same as for uniform spacing. As the grid bias is made more negative to handle larger input signals, the electron flow from the sections of the cathode enclosed by the ends of the grid is cut off. The plate current and other tube characteristics are then dependent on the electron flow through the open section of the grid. This action changes the gain of the tube so that large signals may be handled with minimum distortion due to cross-modulation and modulation-distortion.

Fig. 17 shows a typical plate-current vs. grid-voltage curve for a remote-cutoff type compared with the curve for a type having a uniformly spaced grid. It will be noted that while the curves are similar at small grid-bias voltages, the plate current of the remote-cutoff tube drops quite slowly with large values of bias voltage. This slow change makes it possible for the tube to handle large signals satisfactorily. Because remote-cutoff types can accommodate large and small signals, they are particularly suitable for use in sets having automatic volume control. Remote-cutoff tubes also are known as variable-mu types.

---

**Class A Power Amplifiers**

As a class A power amplifier, an electron tube is used in the output stage of a radio or television receiver to supply a relatively large amount of power to the loudspeaker. For this application, large power output is of more importance than high voltage amplification; therefore, gain possibilities are sacrificed in the design of power tubes to obtain power-handling capability.

Triodes, pentodes, and beam power tubes designed for power amplifier service have certain inherent features for each structure. Power tubes of the triode type for class A service are characterized by low power sensitivity, low plate-power efficiency, and low distortion. Power tubes of the pentode type are characterized by high power sensitivity, high plate-power efficiency and, usually, somewhat higher distortion than class A triodes. Beam power tubes have higher power sensitivity and efficiency than triode or conventional pentode types.

A class A power amplifier is also used as a driver to supply power to a class AB or a class B stage. It is usually advisable to use a triode, rather than a pentode, in a driver stage because of the lower plate impedance of the triode.

Power tubes connected in either parallel or push-pull may be employed as class A amplifiers to obtain increased output. The parallel connection (Fig. 18) provides twice the output of a single tube with the same value of grid-signal voltage. With this connection, the effective transconductance of the stage is doubled, and the effective plate resistance and the load resistance required are halved as compared with single-tube values.

The push-pull connection (Fig. 19), although it requires twice the grid-signal
voltage, provides increased power and has other important advantages over single-tube operation. Distortion caused by even-order harmonics and hum caused by plate-voltage-supply fluctuations are either eliminated or decidedly reduced through cancellation. Because distortion for push-pull operation is less than for single-tube operation, appreciably more than twice single-tube output can be obtained with triodes by decreasing the load resistance for the stage to a value approaching the load resistance for a single tube.

For either parallel or push-pull class A operation of two tubes, all electrode currents are doubled while all dc electrode voltages remain the same as for single-tube operation. If a cathode resistor is used, its value should be about one-third that for a single tube. If oscillations occur with either type of connection, they can often be eliminated by the use of a non-inductive resistor of approximately 100 ohms connected in series with each grid at the socket terminal.

Operation of power tubes so that the grids run positive is inadvisable except under conditions such as those discussed in this section for class AB and class B amplifiers.

**Power-Output Calculations**

Calculation of the power output of a triode used as a class A amplifier with either an output transformer or a choke having low dc resistance can be made without serious error from the plate family of curves by assuming a resistance load. The proper plate current, grid bias, optimum load resistance, and per-cent second-harmonic distortion can also be determined. The calculations are made graphically and are illustrated in Fig. 20 for given conditions. The procedure is as follows:

1. Locate the zero-signal bias point P by determining the zero-signal bias $E_{co}$ from the formula:

$$E_{co} = -(0.68 \times E_b)/\mu$$

where $E_b$ is the chosen value in volts of dc plate voltage at which the tube is to be operated, and $\mu$ is the amplification factor of the tube. This quantity is shown as negative to indicate that a negative bias is used.

2. Locate the value of zero-signal plate current, $I_o$, corresponding to point P.

3. Locate the point $2I_o$, which is twice the value of $I_o$ and corresponds to the value of the maximum-signal plate current $I_{max}$.

4. Locate the point X on the dc bias curve at zero volts, $E_c = 0$, corresponding to the value of $I_{max}$.

5. Draw a straight line XY through X and P.

Line XY is known as the load resistance line. Its slope corresponds to the value of the load resistance. The load resistance in ohms is equal to $(E_{max} - E_{min})$ divided by $(I_{max} - I_{min})$, where $E$ is in volts and $I$ is in amperes.
It should be noted that in the case of filament types of tubes, the calculations are given on the basis of a de-operated filament. When the filament is ac-operated, the calculated value of dc bias should be increased by approximately one-half the filament voltage rating of the tube.

The value of zero-signal plate current \( I_0 \) should be used to determine the plate dissipation, an important factor influencing tube life. In a class A amplifier under zero-signal conditions, the plate dissipation is equal to the power input, i.e., the product of the dc plate voltage \( E_0 \) and the zero-signal dc plate current \( I_0 \). If it is found that the plate-dissipation rating of the tube is exceeded with the zero-signal bias \( E_0 \) calculated above, it will be necessary to increase the bias by a sufficient amount so that the actual plate dissipation does not exceed the rating before proceeding further with the remaining calculations.

For power-output calculations, it is assumed that the peak alternating grid voltage is sufficient (1) to swing the grid from the zero-signal bias value \( E_0 \) to zero bias (\( E_c = 0 \)) on the positive swing and (2) to swing the grid to a value twice the zero-signal bias value on the negative swing. During the negative swing, the plate voltage and plate current reach values of \( E_{\text{max}} \) and \( I_{\text{min}} \); during the positive swing, they reach values of \( E_{\text{min}} \) and \( I_{\text{max}} \). Because power is the product of voltage and current, the power output \( P_0 \) as shown by a wattmeter is given by

\[
P_0 = \frac{(I_{\text{max}} - I_{\text{min}}) \times (E_{\text{max}} - E_{\text{min}})}{8}
\]

where \( E \) is in volts, \( I \) is in amperes, and \( P_0 \) is in watts.

In the output of power amplifier triodes, some distortion is present. This distortion is due predominantly to second harmonics in single-tube amplifiers. The percentage of second-harmonic distortion may be calculated by the following formula:

\[
\% \text{ distortion} = \frac{I_{\text{max}} + I_{\text{min}}}{2 I_{\text{max}} - I_0} \times 100
\]

where \( I_0 \) is the zero-signal plate current in amperes. If the distortion is excessive, the load resistance should be increased or, occasionally, decreased slightly and the calculations repeated.

Example: Determine the load resistance, power output, and distortion of a triode having an amplification factor of 4.2, a plate-dissipation rating of 15 watts, and plate characteristics curves as shown in Fig. 20. The tube is to be operated at 250 volts on the plate.

Procedure: For a first approximation, determine the operating point \( P \) from the zero-signal bias formula, \( E_c = -(0.68 \times 250) / 4.2 = -40.5 \) volts. From the curve for this voltage, it is found that the zero-signal plate current \( I_0 \) at a plate voltage of 250 volts is 0.08 ampere and, therefore, the plate-dissipation rating is exceeded (0.08 \times 250 = 20 watts). Consequently, it is necessary to reduce the zero-signal plate current to 0.06 ampere at 250 volts. The grid bias is now seen to be -43.5 volts. Note that the curve was taken with a dc filament supply; if the filament is to be operated on an ac supply, the bias must be increased by about one-half the filament voltage, or to -45 volts, and the circuit returns made to the mid-point of the filament circuit.

Point X can now be determined. Point X is at the intersection of the dc bias curve at zero volts with \( I_{\text{max}} \), where \( I_{\text{max}} = 2I_0 = 2 \times 0.06 = 0.12 \) ampere. Line XY is drawn through points P and X. \( E_{\text{max}}, E_{\text{min}}, \) and \( I_{\text{max}} \) are then found from the curves. Substituting these values in the power-output formula, we obtain

\[
P_0 = \frac{(0.12 - 0.012) \times (365 - 105)}{8} = 3.52 \text{ watts}
\]

The resistance represented by load line XY is

\[
\frac{(365 - 105)}{0.12 - 0.012} = 2416 \text{ ohms}
\]

When the values from the curves are substituted in the distortion formula, we obtain

\[
\% \text{ distortion} = \frac{2}{0.12 - 0.012} \times 100 = 5.5\%
\]

It is customary to select the load resistance so that the distortion does not exceed five per cent. When the method shown is used to determine the slope of the load resistance line, the second-harmonic distortion generally does not exceed five per cent. In the example, however, the distortion is excessive and it is desirable, therefore, to use a slightly
higher load resistance. A load resistance of 2500 ohms will give a distortion of about 4.9 per cent. The power output is reduced only slightly to 3.5 watts.

Operating conditions for triodes in push-pull depend on the type of operation desired. Under class A conditions, distortion, power output, and efficiency are all relatively low. The operating bias can be anywhere between that specified for single-tube operation and that equal to one-half the grid-bias voltage required to produce plate-current cutoff at a plate voltage of $1.4E_0$, where $E_0$ is the operating plate voltage. Higher bias than this value requires higher grid-signal voltage and results in class AB operation which is discussed later.

The method for calculating maximum power output for triodes in push-pull class A operation is as follows: Erect a vertical line at 0.6 $E_0$, (see Fig. 21), intersecting the $E_c=0$ curve at the point $I_{\text{MAX}}$. Then, $I_{\text{MAX}}$ is determined from the curve for use in the formula

$$P_o = \frac{(I_{\text{MAX}} \times E_0)}{5}$$

If $I_{\text{MAX}}$ is expressed in amperes and $E_0$ in volts, power output is in watts.

The method for determining the proper load resistance for triodes in push-pull is as follows: Draw a load line through $I_{\text{MAX}}$ on the zero-bias curve and through the $E_0$ point on the zero-current axis. Four times the resistance represented by this load line is the plate-to-plate load ($R_{pp}$) for two triodes in a class A push-pull amplifier. Expressed as a formula,

$$R_{pp} = 4 \times \frac{(E_0 - 0.6E_0)}{I_{\text{MAX}}}$$

where $E_0$ is expressed in volts, $I_{\text{MAX}}$ in amperes, and $R_{pp}$ in ohms.

Example: Assume that the plate voltage ($E_0$) is to be 300 volts, and the plate dissipation rating of the tube is 15 watts. Then, for class A operation, the operating bias can be equal to, but not more than, one-half the grid bias for cut-off with a plate voltage of $1.4 \times 300 = 420$ volts. (Since cutoff bias is approximately –115 volts at a plate voltage of 420 volts, one-half of this value is –57.5 volts bias.) At this bias, the plate current is found from the plate family to be 0.054 ampere and, therefore, the plate dissipation is 0.054 $\times$ 300 or 16.2 watts. Since –57.5 volts is the limit of bias for class A operation of these tubes at a plate voltage of 300 volts, the dissipation cannot be reduced by increasing the bias and it, therefore, becomes necessary to reduce the plate voltage.

If the plate voltage is reduced to 250 volts, the bias will be found to be –43.5 volts. For this value, the plate current is 0.06 ampere, and the plate dissipation is 15 watts. Then, following the method for calculating power output, erect a vertical line at 0.6$E_0$ = 150 volts. The intersection of the line with the curve $E_c = 0$ is $I_{\text{MAX}}$ or 0.2 amperes. When this value is substituted in the power formula, the power output is $(0.2 \times 250) / 5 = 10$ watts. The load resistance is determined from the load formula: Plate-to-plate load ($R_{pp}$) = $4 \times (250 - 150) / 0.2$ = 2000 ohms.

Power output for a pentode or a beam power tube as a class A amplifier can be calculated in much the same way as for triodes. The calculations can be made graphically from a special plate family of curves, as illustrated in Fig. 22. From a point A at or just below the knee of the zero-bias curve, draw arbitrarily selected load lines to intersect the zero-plate-current axis. These lines should be on both sides of the operating...
point P whose position is determined by the desired operating plate voltage, \( E_0 \), and one-half the maximum-signal plate current. Along any load line, say \( AA_1 \), measure the distance \( AO_1 \). On the same line, lay off an equal distance, \( O_1A_1 \). For optimum operation, the change in bias from A to \( O_1 \) should be nearly equal to the change in bias from \( O_1 \) to \( A_1 \). If this condition cannot be met with one line, the total (2nd and 3rd) harmonic distortion = \( \sqrt{\left(\%2\text{nd}\right)^2 + \left(\%3\text{rd}\right)^2} \)

**Conversion Factors**

Operating conditions for voltage values other than those shown in the published data can be obtained by the use of the nomograph shown in Fig. 23 when all electrode voltages are changed simultaneously in the same ratio. The nomograph includes conversion factors for current \( (I_c) \), power output \( (P_0) \), plate resistance or load resistance \( (R_L) \), and transconductance \( (F_gm) \) for voltage ratios between 0.5 and 2.0. These factors are expressed as functions of the ratio between the desired or new voltage for any electrode \( (E_{des}) \) and the published or original value of that voltage \( (E_{pub}) \). The relations shown are applicable to triodes and multigrid tubes in all classes of service.

To use the nomograph, simply place a straight-edge across the page so that it intersects the scales for \( E_{des} \) and \( E_{pub} \) at the desired values. The desired conversion factor may then be read directly or estimated at the point where the straight-edge intersects the \( F_i \), \( F_p \), \( F_r \), or \( F_{gm} \) scale.

For example, suppose it is desired to operate two 6L6-GB's in class A, push-pull, fixed bias, with a plate voltage of 200 volts. The nearest published operating conditions for this class of service are for a plate voltage of 250 volts. The operating conditions for the new plate voltage can be determined as follows:

The voltage conversion factor, \( F_v \),
is equal to 200/250 or 0.8. The dashed lines on the nomograph of Fig. 23 indicate that for this voltage ratio \( F_i \) is approximately 0.72, \( F_p \) is approximately 0.57, \( F_r \) is 1.12, and \( F_{gm} \) is approximately 0.892. These factors may be applied directly to operating values shown in the tube data, or to values calculated by the methods described previously.

Because this method for conversion of characteristics is necessarily an approximation, the accuracy of the nomograph decreases progressively as the ratio \( E_{des}/E_{pub} \) departs from unity. In general, results are substantially correct when the value of the ratio \( E_{des}/E_{pub} \) is between 0.7 and 1.5. Beyond these limits, the accuracy decreases rapidly, and the results obtained must be considered rough approximations.

The nomograph does not take into consideration the effects of contact potential or secondary emission in tubes. Emission may occur in conventional tetrodes, however, if the plate voltage swings below the grid-No.2 voltage. Consequently, the conversion factors shown in the nomograph apply to such tubes only when the plate voltage is greater than the grid-No.2 voltage. Because secondary emission may also occur in certain beam power tubes at very low values of plate current and plate voltage, the conversion factors shown in the nomograph do not apply when these tubes are operated under such conditions.

### Class AB Power Amplifiers

A class AB power amplifier employs two tubes connected in push-pull with a higher negative grid bias than is
used in a class A stage. With this higher negative bias, the plate and screen-grid voltages can usually be made higher than for class A amplifiers because the increased negative bias holds plate current within the limit of the tube's plate-dissipation rating. As a result of these higher voltages, more power output can be obtained from class AB operation.

Class AB amplifiers are subdivided into class AB₁ and class AB₂. In class AB₁, there is no flow of grid current. That is, the peak signal voltage applied to each grid is not greater than the negative grid-bias voltage. The grids therefore are not driven to a positive potential and do not draw current. In class AB₂, the peak signal voltage is greater than the bias so that the grids are driven positive and draw current.

Because of the flow of grid current in a class AB₁ stage there is a loss of power in the grid circuit. The sum of this loss and the loss in the input transformer is the total driving power required by the grid circuit. The driver stage should be capable of a power output considerably larger than this required power in order that distortion introduced in the grid circuit be kept low. The input transformer used in a class AB₂ amplifier usually has a step-down turns ratio.

Because of the large fluctuations of plate current in a class AB₂ stage, it is important that the plate power supply should have good regulation. Otherwise the fluctuations in plate current cause plate-to-plate load resistance remains constant.

Under these conditions, grid bias has no appreciable effect on the power output. Grid bias cannot be neglected, however, since it is used to find the zero-signal plate current and, from it, the zero-signal plate dissipation. Because the grid bias is higher in class AB₁ than in class A service for the same plate voltage, a higher signal voltage may be used without grid current being drawn and, therefore, higher power output is obtained than in class A service.

In general, for any load line through point D, Fig. 24, the plate-to-plate load
resistance in ohms of a push-pull amplifier is \( R_{pp} = 4E_o/I' \), where \( I' \) is the plate current value in amperes at which the load line as projected intersects the plate current axis, and \( E_o \) is in volts. This formula is another form of the one given under push-pull class A amplifiers, \( R_{pp} = 4(E_o - 0.6E_o)/I_{max} \), but is more general. Power output = \((I_{max}/\sqrt{2})^2 \times R_{pp}/4\), where \( I_{max} \) is the peak plate current at zero grid volts for the load chosen. This formula simplified is \((I_{max})^2 \times R_{pp}/8\). The maximum-signal average plate current is \( 2I_{max}/\pi \) or 0.636 \( I_{max} \); the maximum-signal average power input is 0.636 \( I_{max} \times E_o \).

It is desirable to simplify these formulas for a first approximation. This simplification can be made if it is assumed that the peak plate current, \( I_{max} \), occurs at the point of the zero-bias curve corresponding approximately to 0.6 \( E_o \), the condition for maximum power output. The simplified formulas are:

\[
\begin{align*}
P_o \text{ (for two tubes)} &= (I_{max} \times E_o)/5 \\
R_{pp} &= 1.6E_o/I_{max}
\end{align*}
\]

where \( E_o \) is in volts, \( I_{max} \) is in amperes, \( R_{pp} \) is in ohms, and \( P_o \) is in watts.

It may be found during subsequent calculations that the distortion or the plate dissipation is excessive for this approximation; in that case, a different load resistance must be selected using the first approximation as a guide and the process repeated to obtain satisfactory operating conditions.

Example: Fig. 24 illustrates the application of this method to a pair of 2A3s operated at \( E_o = 300 \) volts. Each tube has a plate-dissipation rating of 15 watts. The method is to erect a vertical line at 0.6 \( E_o \), or at 180 volts, which intersects the \( E_o = 0 \) curve at the point \( I_{max} = 0.26 \) ampere. Using the simplified formulas, we obtain

\[
\begin{align*}
R_{pp} &= (1.6 \times 300)/0.26 = 1845 \text{ ohms} \\
P_o &= (0.26 \times 300)/5 = 15.6 \text{ watts}
\end{align*}
\]

At this point, it is well to determine the plate dissipation and to compare it with the maximum rated value. From the average plate current formula (0.636 \( I_{max} \) mentioned previously, the maximum-signal average plate current is 0.166 ampere. The product of this current and the operating plate voltage is 49.8 watts, the average input to the two tubes. From this value, subtract the power output of 15.6 watts to obtain the total dissipation for both tubes which is 34.2 watts. Half of this value, 17 watts, is in excess of the 15-watt rating of the tube and it is necessary, therefore, to assume another and higher load resistance so that the plate-dissipation rating will not be exceeded.

It will be found that at an operating plate voltage of 300 volts the 2A3's require a plate-to-plate load resistance of 3000 ohms. From the formula for \( R_{pp} \), the value of \( I' \) is found to be 0.4 ampere. The load line for the 3000-ohm load resistance is then represented by a straight line from the point \( I' = 0.4 \) ampere on the plate-current ordinate to the point \( E_o = 300 \) volts on the plate-voltage abscissa. At the intersection of the load line with the zero-bias curve, the peak plate current, \( I_{max} \), can be read at 0.2 ampere. Then

\[
\begin{align*}
P_o &= (I_{max}/\sqrt{2})^2 \times R_{pp}/4 \\
&= (0.2/1.41)^2 \times 3000/4 \\
&= 15 \text{ watts}
\end{align*}
\]

Proceeding as in the first approximation, we find that the maximum-signal average plate current, 0.636 \( I_{max} \), is 0.127 ampere, and the maximum-signal average power input is 38.1 watts. This input minus the power output is 38.1 - 15 = 23.1 watts. This value is the dissipation for two tubes; the value per tube is 11.6 watts, a value well within the rating of this tube type.

The operating bias and the zero-signal plate current may now be found by use of a curve which is derived from the plate family and the load line. Fig. 25 is a curve of instantaneous values of plate current and dc grid-bias voltages taken from Fig. 24. Values of grid bias are read from each of the grid-bias curves of Fig. 24 along the load line and are transferred to Fig. 25 to produce the curved line from A to C. A tangent to this curve, starting at A, is drawn to intersect the grid-voltage abscissa. The point of intersection, B, is the operating grid bias for fixed-bias operation. In the example, the bias is -60 volts. Refer back to the plate family at the operating conditions of plate volts=300 and grid bias=-60 volts; the zero-signal plate current per tube is seen to be 0.04 ampere.
This procedure locates the operating point for each tube at P. The plate current must be doubled, of course, to obtain the zero-signal plate current for both tubes. Under maximum-signal conditions, the signal voltage swings from zero-signal bias voltage to zero bias for each tube on alternate half cycles. Hence, in the example, the peak of signal voltage per tube is 60 volts, or the grid-to-grid value is 120 volts.

As in the case of the push-pull class A amplifier, the second-harmonic distortion in a class AB amplifier using triodes is very small and is largely canceled by virtue of the push-pull connection. Third-harmonic distortion, however, which may be larger than permissible, can be found by means of composite characteristic curves. A complete family of curves can be plotted, but for the present purpose only the one corresponding to a grid bias of one-half the peak grid-voltage swing is needed. In the example, the peak grid voltage per tube is 60 volts, and the half value is 30 volts. The composite curve, since it is nearly a straight line, can be constructed with only two points (see Fig. 24). These two points are obtained from deviations above and below the operating grid and plate voltages.

In order to find the curve for a bias of -30 volts, we have assumed a deviation of 30 volts from the operating grid voltage of -60 volts. Next assume a deviation from the operating plate voltage of, say, 40 volts. Then at 300 - 40 = 250 volts, erect a vertical line to intersect the (-60) - (-30) = -30-volt bias curve and read the plate current at this intersection, which is 0.167 ampere; likewise, at the intersection of a vertical line at 300 + 40 = 340 volts and the (-60) + (-30) = -90-volt bias curve, read the plate current. In this example, the plate current is estimated to be 0.002 ampere. The difference of 0.165 ampere between these two currents determines the point E on the 360 - 40 = 260-volt vertical. Similarly, another point F on the same composite curve is found by assuming the same grid-bias deviation but a larger plate-voltage deviation, say, 100 volts.

We now have points at 250 volts and 0.165 ampere (E), and at 200 volts and 0.045 ampere (F). A straight line through these points is the composite curve for a bias of -30 volts, shown as a long-short dash line in Fig. 24. At the intersection of the composite curve and the load line, G, the instantaneous composite plate current at the point of one-half the peak signal swing is determined. This current value, designated Io, is and the peak plate current, Imax, are used in the following formula to find peak value of the third-harmonic component of the plate current.

\[ I_{h3} = \frac{(2I_{e4} - I_{max})}{3} \]

In the example, where Io is 0.097 ampere and Imax is 0.2 amperes, \( I_{h3} = \frac{(2 \times 0.097 - 0.2)}{3} = 0.194 - 0.2 - 0.006/3 = -0.002 \) ampere. (The fact that \( I_{h3} \) is negative indicates that the phase relation of the fundamental (first-harmonic) and third-harmonic components of the plate current is such as to result in a slightly peaked wave form. \( I_{h3} \) is positive in some cases, indicating a flattening of the wave form.)

The peak value of the fundamental or first-harmonic component of the plate current is found by the following formula:

\[ I_{h1} = \frac{2}{3} \times (I_{max} + I_{o.d}) \]

In the example, \( I_{h1} = \frac{2}{3} \times (0.2 + 0.097) = 0.198 \) ampere. Thus, the percentage of third-harmonic distortion is \( I_{h3}/I_{h1} \times 100 = (0.002/0.198) \times 100 = 1 \) per cent approx.

**Class AB₂ Power Amplifiers**

A class AB₂ amplifier employs two tubes connected in push-pull as in the case of class AB₁ amplifiers. It differs in that it is biased so that plate current flows for somewhat more than half the electrical cycle but less than the full cycle, the peak signal voltage is greater than the dc bias voltage, grid current is drawn, and consequently, power is consumed in the grid circuit. These conditions permit high power output to be obtained without excessive plate dissipation.

The sum of the power used in the grid circuit and the losses in the input transformer is the total driving power required by the grid circuit. The driver stage should be capable of a power output considerably larger than this required power in order that distortion
introduced in the grid circuit be kept low. In addition, the internal impedance of the driver stage as reflected into or as effective in the grid circuit of the power stage should always be as low as possible in order that distortion may be kept low. The input transformer used in a class AB₂ stage usually has a step-down ratio adjusted for this condition.

Load resistance, plate dissipation, power output, and distortion determinations are similar to those for class AB₂. These quantities are interdependent with peak grid-voltage swing and driving power; a satisfactory set of operating conditions involves a series of approximations. The load resistance and signal swing are limited by the permissible grid current and power, and the distortion. If the load resistance is too high or the signal swing is excessive, the plate-dissipation rating will be exceeded, distortion will be high, and the driving power will be unnecessarily high.

**Class B Power Amplifiers**

A class B amplifier employs two tubes connected in push-pull, so biased that plate current is almost zero when no signal voltage is applied to the grids. Because of this low value of no-signal plate current, class B amplification has the same advantage as class AB₂, i.e., large power output can be obtained without excessive plate dissipation. Class B operation differs from class AB₂ in that plate current is cut off for a larger portion of the negative grid swing, and the signal swing is usually larger than in class AB₂ operation.

Because tubes designed for use as class B amplifiers usually operate at zero or low bias, each grid is at a positive potential during all or most of the positive half-cycle of its signal swing and consequently draws considerable grid current. There is, therefore, a loss of power in the grid circuit. This condition imposes the same requirement in the driver stage as in a class AB₂ stage, that is, the driver should be capable of delivering considerably more power output than the power required for the class B grid circuit in order that distortion be low. Likewise, the interstage transformer between the driver and class B stage usually has a step-down turns ratio.

Determination of load resistance, plate dissipation, power output, and distortion is similar to that for a class AB₂ stage.

Power amplifier tubes designed for class A operation can be used in class AB₂ and class B service under suitable operating conditions. There are several tube types designed especially for class B service. The characteristic common to all of these types is a high amplification factor. With a high amplification factor, plate current is small even when the grid bias is zero. These tubes, therefore, can be operated in class B service at a bias of zero volts so that no bias supply is required. A number of class B amplifier tubes consist of two triode units mounted in one tube. The two units can be connected in push-pull so that only one tube is required for a class B stage. An example of a twin triode used in class B service is the 6N7.

**Cathode-Drive Circuits**

The preceding text has discussed the use of tubes in the conventional grid-drive type of amplifier—that is, where the cathode is common to both the input and output circuits. Tubes may also be employed as amplifiers in circuit arrangements which utilize the grid or plate as the common terminal. Probably the most important of these amplifiers are the cathode-drive circuit, which is discussed below, and the cathode-follower circuit, which will be discussed later in connection with inverse feedback.

A typical cathode-drive circuit is shown in Fig. 26. The load is placed in

![Fig. 26](image-url)
voltage is applied across an appropriate impedance in the cathode circuit. The cathode-drive circuit is particularly useful for vhf and uhf applications, in which it is necessary to obtain the low-noise performance usually associated with a triode, but where a conventional grid-drive circuit would be unstable because of feedback through the grid-to-plate capacitance of the tube. In the cathode-drive circuit, the grounded grid serves as a capacitive shield between plate and cathode and permits stable operation at frequencies higher than those in which conventional circuits can be used.

The input impedance of a cathode-drive circuit is approximately equal to $1/g_m$ when the load resistance is small compared to the $r_1$ of the tube. A certain amount of power is required, therefore, to drive such a circuit. However, in the type of service in which cathode-drive circuits are normally used, the advantages of the grounded-grid connection usually outweigh this disadvantage.

**Inverse Feedback**

An inverse-feedback circuit, sometimes called a degenerative circuit, is one in which a portion of the output voltage of a tube is applied to the input of the same or a preceding tube in opposite phase to the signal applied to the tube. Two important advantages of feedback are: (1) reduced distortion from each stage included in the feedback circuit and (2) reduction in the variations in gain due to changes in line voltage, possible differences between tubes of the same type, or variations in the values of circuit constants included in the feedback circuit.

Inverse feedback is used in audio amplifiers to reduce distortion in the output stage where the load impedance on the tube is a loudspeaker. Because the impedance of a loudspeaker is not constant for all audio frequencies, the load impedance on the output tube varies with frequency. When the output tube is a pentode or beam power tube having high plate resistance, this variation in plate load impedance can, if not corrected, produce considerable frequency distortion. Such frequency distortion can be reduced by means of inverse feedback. Inverse-feedback circuits are of the constant-voltage type and the constant-current type.

The application of the constant-voltage type of inverse feedback to a power output stage using a single beam power tube is illustrated by Fig. 27. In this circuit, $R_s$, $R_g$, and $C$ are connected as a voltage divider across the output of the tube. The secondary of the grid-input transformer is returned to a point on this voltage divider. Capacitor $C$ blocks the dc plate voltage from the grid. However, a portion of the tube's af output voltage, approximately equal to the output voltage multiplied by the fraction $R_s/(R_i + R_s)$, is applied to the grid. This voltage lowers the source impedance of the circuit and a decrease in distortion results which is explained in the curves of Fig. 28.

Consider first the amplifier without the use of inverse feedback. Suppose that when a signal voltage $e_i$ is applied to the grid the af plate current $i'_m$ has an irregularity in its positive half-cycle. This irregularity represents a departure from the waveform of the input signal and is, therefore, distortion. For this plate-current waveform, the af plate voltage has a waveform shown by $e'_o$. The plate-voltage waveform is inverted compared to the plate-current waveform because a plate-current increase produces an increase in the drop across the plate load. The voltage at the plate is the difference between the drop across the load and the supply voltage; thus, when plate current goes up, plate voltage goes down; when plate current goes down, plate voltage goes up.

Now suppose that inverse feedback is applied to the amplifier. The voltage fed back to the grid has the same waveform and phase as the plate voltage, but
is smaller in magnitude. Hence, with a plate voltage of waveform shown by $e'_p$, the feedback voltage appearing on the grid is as shown by $e'_g$. This voltage obtained full power output, but this output is obtained with less distortion.

Inverse feedback may also be applied to resistance-coupled stages as applied to the grid produces a component of plate current $i'_{pr}$. It is evident that the irregularity in the waveform of this component of plate current would act to cancel the original irregularity and thus reduce distortion.

After inverse feedback has been applied, the relations are as shown in the curve for $i_p$. The dotted curve shown by $i'_{pr}$ is the component of plate current due to the feedback voltage on the grid. The dotted curve shown by $i'_p$ is the component of plate current due to the signal voltage on the grid. The algebraic sum of these two components gives the resultant plate current shown by the solid curve of $i_p$. Since $i'_p$ is the plate current that would flow without inverse feedback, it can be seen that the application of inverse feedback has reduced the irregularity in the output current. In this manner inverse feedback acts to correct any component of plate current that does not correspond to the input signal voltage, and thus reduces distortion.

From the curve for $i_p$, it can be seen that, besides reducing distortion, inverse feedback also reduces the amplitude of the output current. Consequently, when inverse feedback is applied to an amplifier there is a decrease in gain or power sensitivity as well as a decrease in distortion. Hence, the application of inverse feedback to an amplifier requires that more driving voltage be applied to shown in Fig. 29. The circuit is conventional except that a feedback resistor, $R_3$, is connected between the plates of tubes $T_1$ and $T_2$. The output signal voltage of $T_1$ and a portion of the output signal voltage of $T_2$ appears across $R_2$. Because the distortion generated in the plate circuit of $T_2$ is applied to its grid out of phase with the input signal, the distortion in the output of $T_2$ is comparatively low. With sufficient inverse feedback of the constant-voltage type in a power-output stage, it is not necessary to employ a network of resistance and capacitance in the output circuit to reduce response at high audio frequencies. Inverse-feedback circuits can also be applied to push-pull class A and class AB amplifiers.

Constant-current inverse feedback is usually obtained by omitting the bypass capacitor across a cathode resistor.

This method decreases the gain and the distortion but increases the source impedance of the circuit. Consequently,
the output voltage rises at the resonant frequency of the loudspeaker and accentuates hangover effects.

Inverse feedback is not generally applied to a triode power amplifier, such as the 2A3, because the variation in speaker impedance with frequency does not produce much distortion in a triode stage having low plate resistance. It is sometimes applied in a pentode stage but is not always convenient. As has been shown, when inverse feedback is used in an amplifier, the driving voltage must be increased in order to give full power output. When inverse feedback is used with a pentode, the total driving voltage required for full power output may be inconveniently large, although still less than that required for a triode. Because a beam power tube gives full power output on a comparatively small driving voltage, inverse feedback is especially applicable to beam power tubes. By means of inverse feedback, the high efficiency and high power output of beam power tubes can be combined with freedom from the effects of varying speaker impedance.

**Cathode-Follower Circuits**

Another important application of inverse feedback is in the cathode-follower circuit, an example of which is given in Fig. 30. In this application, the load has been transferred from the plate circuit to the cathode circuit of the tube. The input voltage is applied between the grid and ground and the output voltage is obtained between the cathode and ground. The voltage amplification (V.A.) of this circuit is always less than unity and may be expressed by the following convenient formulas.

For a triode:

\[ V.A. = \frac{\mu \times R_L}{r_p + R_L \times (\mu + 1)} \]

For a pentode:

\[ V.A. = \frac{g_m \times R_L}{1 + (g_m \times R_L)} \]

In these formulas, \( \mu \) is the amplification factor, \( R_L \) is the load resistance in ohms, \( r_p \) is the plate resistance in ohms, and \( g_m \) is the transconductance in mhos.

The use of the cathode follower permits the design of circuits which have high input resistance and high output voltage. The output impedance is quite low and very low distortion may be obtained. Cathode-follower circuits may be used for power amplifiers or as impedance transformers designed either to match a transmission line or to produce a relatively high output voltage at a low impedance level.

In a power amplifier which is transformer coupled to the load, the same output power can be obtained from the tube as would be obtained in a conventional grid-drive type of amplifier. The output impedance is very low and provides excellent damping to the load, with the result that very low distortion can be obtained. The peak-to-peak signal voltage, however, approaches 1\( \frac{1}{2} \) times the plate supply voltage if maximum power output is required from the tube. Some problems may be encountered, therefore, in the design of an adequate driver stage for a cathode-follower output system.

When a cathode-follower circuit is used as an impedance transformer, the load is usually a simple resistance in the cathode circuit of the tube. With relatively low values of cathode resistor, the circuit may be designed to supply significant amounts of power and to match the impedance of the device to a transmission line. With somewhat higher values of cathode resistor, the circuit may be used to lower the output impedance sufficiently to permit the transmission of audio signals along a line in which appreciable capacitance is present.

The cathode follower may also be used as an isolation device to provide extremely high input resistance and low input capacitance as might be required in the probe of an oscilloscope or vacuum-tube voltmeter. Such circuits can be
designed to provide effective impedance transformation with no significant loss of voltage.

Selection of a suitable tube and its operating conditions for use in a cathode-follower circuit having a specified output impedance ($Z_o$) can be made, in most practical cases, by the use of the following formula to determine the approximate value of the required tube transconductance.

$$\text{Required } g_m \text{ (\muhm)} = \frac{1,000,000}{Z_o \text{ (ohms)}}$$

Once the required transconductance is obtained, a suitable tube and its operating conditions may be determined from the technical data given in the TUBE TYPES SECTION. The conversion nomograph given in Fig. 23 may be used for calculation of operating conditions for values of transconductance not included in the tabulated data. After the operating conditions have been determined, the approximate value of the required cathode load resistance may be calculated from the following formulas.

For triode:

$$\text{Cathode } R_L = \frac{Z_o \times r_p}{r_p - Z_o \times (1 + \mu)}$$

For pentode:

$$\text{Cathode } R_L = \frac{Z_o}{1 - (g_m \times Z_o)}$$

Resistance and impedance values are in ohms; transconductance values are in mhos.

If the value of the cathode load resistance calculated to give the required output impedance does not give the required operating bias, the basic cathode-follower circuit can be modified in a number of ways. Two of the more common modifications are given in Figs. 31 and 32.

In Fig. 31 the bias is increased by adding a bypassed resistance between the cathode and the unbypassed load resistance and returning the grid to the low end of the load resistance. In Fig. 32 the bias is reduced by adding a bypassed resistance between the cathode and the unbypassed load resistance but, in this case, the grid is returned to the junction of the two cathode resistors so that the bias voltage is only the dc voltage drop across the added resistance. The size of the bypass capacitor should be large enough so that it has negligible reactance at the lowest frequency to be handled. In both cases the B-supply should be increased to make up for the voltage taken for biasing.

Example: Select a suitable tube and determine the operating conditions and circuit components for a cathode-follower circuit having an output impedance that will match a 500-ohm transmission line. Procedure: First, determine the approximate transconductance required.

$$\text{Required } g_m = \frac{1,000,000}{500} = 2000 \mu\text{hmhos}$$

A survey of the tubes that have a transconductance in this order of magnitude shows that type 12AX7 is among the tubes to be considered. Referring to the characteristics given in the technical data section for one triode unit of high-mu twin triode 12AX7, we find that for a plate voltage of 250 volts and a bias of -2 volts, the transconductance is 1600 micromhos, the plate resistance is 62500 ohms, the amplification factor is 100, and the plate current is 0.0012 ampere.
When these values are used in the expression for determining the cathode load resistance, we obtain

\[
\text{Cathode } R_L = \frac{500 \times 62500}{62500 - 500 \times (100 + 1)} = 2600 \text{ ohms}
\]

The voltage across this resistor for a plate current of 0.0012 ampere is 2600 \times 0.0012 = 3.12 volts. Because the required bias voltage is only -2 volts, the circuit arrangement given in Fig. 30 is employed. The bias is furnished by a resistance that will have a voltage drop of 2 volts when it carries a current of 0.0012 ampere. The required bias resistance, therefore, is \(2/0.0012 = 1670\) ohms. If 60 cycles per second is the lowest frequency to be passed, 20 microfarads is a suitable value for the bypass capacitor. The B-supply, of course, is increased by the voltage drop across the cathode resistance which, in this example, is approximately 5 volts. The B-supply, therefore, is \(250 + 5 = 255\) volts.

Because it is desirable to eliminate, if possible, the bias resistor and bypass capacitor, it is worthwhile to try other tubes and other operating conditions to obtain a value of cathode load resistance which will also provide the required bias. If the triode section of twin diode—high-mu triode 6AT6 is operated under the conditions given in the technical data section with a plate voltage of 100 volts and a bias of -1 volt, it will have an amplification factor of 70, a plate resistance of 54000 ohms, a transconductance of 1300 micromhos, and a plate current of 0.0008 ampere.

Then,

\[
\text{Cathode } R_L = \frac{500 \times 54000}{54000 - 500 \times (70 + 1)} = 1460 \text{ ohms}
\]

The bias voltage obtained across this resistance is 1460 \times 0.0008 = 1.17 volts. Since this value is for all practical purposes close enough to the required bias, no additional bias resistance will be required and the grid may be returned directly to ground. There is no need to adjust the B-supply voltage to make up for the drop in the cathode resistor. The voltage amplification (V.A.) for the cathode-follower circuit utilizing the triode section of type 6AT6 is

\[
\text{V.A.} = \frac{70 \times 1460}{54000 + 1460 \times (70 + 1)} = 0.65
\]

For applications in which the cathode follower is used to isolate two circuits—for example, when it is used between a circuit being tested and the input stage of an oscilloscope or a vacuum-tube voltmeter—voltage output and not impedance matching is the primary consideration. In such applications it is desirable to use a relatively high value of cathode load resistance, such as 50,000 ohms, in order to get the maximum voltage output. In order to obtain proper bias, a circuit such as that of Fig. 32 should be used. With a high value of cathode resistance, the voltage amplification will approximate unity.

**Corrective Filters**

A corrective filter can be used to improve the frequency characteristic of an output stage using a beam power tube or a pentode when inverse feedback is not applicable. The filter consists of a resistor and a capacitor connected in series across the primary of the output transformer. Connected in this way, the filter is in parallel with the plate load impedance reflected from the voice-coil by the output transformer. The magnitude of this reflected impedance increases with increasing frequency in the middle and upper audio range. The impedance of the filter, however, decreases with increasing frequency. It follows that by use of the proper values for the resistance and the capacitance in the filter, the effective load impedance on the output tubes can be made practically constant for all frequencies in the middle and upper audio range. The result is an improvement in the frequency characteristic of the output stage.

The resistance to be used in the filter for a push-pull stage is 1.3 times the recommended plate-to-plate load resistance; or, for a single-tube stage, is 1.3 times the recommended plate load resistance. The capacitance in the filter should have a value such that the voltage gain of the output stage at a frequency of 1000 cycles or higher is equal to the voltage gain at 400 cycles.

A method of determining the proper value of capacitance for the filter is to make two measurements of the output voltage across the primary of the output transformer: first, when a 400-cycle sig-
nal is applied to the input, and second, when a 1000-cycle signal of the same voltage as the 400-cycle signal is applied to the input. The correct value of capacitance is the one which gives equal output voltages for the two signal inputs. In practice, this value is usually found to be in the order of 0.05 microfarad.

**Volume Expanders**

A volume expander can be used in a phonograph amplifier to make more natural the reproduction of music which has a very large volume range. For instance, in the music of a symphony orchestra, the sound intensity of the loud passages is very much higher than that of the soft passages. When this music is recorded, it may not be feasible to make the ratio of maximum amplitude to minimum amplitude as large on the record as it is in the original music. The recording process may therefore be monitored so that the volume range of the original is compressed on the record. To compensate for this compression, a volume-expander amplifier has a variable gain which is greater for a high-amplitude signal than for a low-amplitude signal. The volume expander, therefore, amplifies loud passages more than soft passages.

A volume expander circuit is shown in Fig. 33. In this circuit, the gain of the 6L7 as an audio amplifier can be varied by changing the bias on grid No. 3. When the bias on grid No. 3 is made less negative, the gain of the 6L7 increases. The signal to be amplified is applied to grid No. 1 of the 6L7 and is amplified by the 6L7. The signal is also applied to the grid of the 6J5, is amplified by the 6J5, and is rectified by the 6H6. The rectified voltage developed across $R_6$, the load resistor of the 6H6, is applied as a positive bias voltage to grid No. 3 of the 6L7.

Then, when the amplitude of the signal input increases, the voltage across $R_4$ increases, and the bias on grid No. 3 of the 6L7 is made less negative. Because this reduction in bias increases the gain of the 6L7, the gain of the amplifier increases with increase in signal amplitude and thus produces volume expansion of the signal. The voltage gain of the expander varies from 5 to 20.

Grid No. 1 of the 6L7 is a variable-mu grid and, therefore, will produce distortion if the input signal voltage is too large. For that reason, the signal input to the 6L7 should not exceed a peak value of 1 volt. The no-signal bias voltage on grid No. 3 is controlled by adjustment of contact P. This contact should be adjusted initially to give a no-signal plate current of 0.15 milliamperes in the 6L7. No further adjustment of contact P is required if the same 6L7 is always used. If it is desired to delay volume expansion until the signal input reaches a certain amplitude, the delay voltage can be inserted as a negative bias on the 6H6 plates at the point marked X in the diagram. All terminal points on the powersupply voltage divider should be adequately bypassed.

**Phase Inverters**

A phase inverter is a circuit used to provide resistance coupling between the output of a single-tube stage and the input of a push-pull stage. The necessity for a phase inverter arises because the
signal-voltage inputs to the grids of a push-pull stage must be 180 degrees out of phase and approximately equal in amplitude with respect to each other. Thus, when the signal voltage input to a push-pull stage swings the grid of one tube in a positive direction, it should swing the grid of the other tube in a negative direction by a similar amount. With transformer coupling between stages, the out-of-phase input voltage to the push-pull stage is supplied by means of the center-tapped secondary. With resistance coupling, the out-of-phase input voltage is obtained by means of the inverter action of a tube. The sum of $R_3$ and $R_4$. The ratio of $R_3 + R_4$ to $R_6$ should be the same as the voltage gain ratio of $T_1$. In order to apply the correct value of signal voltage to $T_2$. The value of $R_4$ is, therefore, equal to $R_4$ divided by the voltage gain of $T_1$. $R_3$ is equal to $R_2$ minus $R_5$. Values of $R_3$, $R_2$, $R_4$ plus $R_3$, and $R_4$ may be taken from the chart in the RESISTANCE-COUPLED AMPLIFIER SECTION. In the practical application of this circuit, it is convenient to use a twin-triode tube combining $T_1$ and $T_2$.

**Tone Controls**

A tone control is a variable filter (or one in which at least one element is adjustable) by means of which the user may vary the frequency response of an amplifier to suit his own taste. In radio receivers and home amplifiers, the tone control usually consists of a resistance-capacitance network in which the resistance is the variable element.

The simplest form of tone control is a fixed tone-compensating or "equalizing" network such as that shown in Fig. 35. This type of network is often used to equalize the low- and high-frequency response of a crystal phonograph pickup. At low frequencies the attenuation of this network is 20.8 db. As the frequency is increased, the 100-microfarad capacitor serves as a bypass for the 5-megohm resistor, and the combined impedance of the resistor-capacitor network is lowered. Thus, more of the crystal output appears across the 0.5-megohm resistor at high frequencies than at low frequencies, and the frequency response at the grid is reasonably flat over a wide frequency range. Fig. 36 shows a comparison between the output of the crystal (curve A) and the output of the equalizing network (curve B). The response curve can be "flattened" still more if the attenuation at low fre-
frequencies is increased by changing the 0.5-megohm resistor to 0.125 megohm.

![Graph showing attenuation vs. frequency](image)

**Fig. 36**

The tone-control network shown in Fig. 37 has two stages with completely separate bass and treble controls. Fig. 38 shows simplified representations of the bass control of this circuit when the potentiometer is turned to its extreme variations (usually labeled “Boost” and “Cut”). In this network, as in the crystal-equalizing network shown in Fig. 35, the parallel RC combination is the controlling factor. For bass “boost”, the capacitor \( C_2 \) bypasses resistor \( R_b \) so that less impedance is placed across the output to grid B at high frequencies than at low frequencies. For bass “cut,” the parallel combination is shifted so that \( C_1 \) bypasses \( R_a \), causing more high-frequency than low-frequency output. Essentially, the network is a variable-frequency voltage divider. With proper values for the components, it may be made to respond to changes in the \( R_p \) potentiometer setting for only low frequencies (below 1000 cycles).

Fig. 39 shows extreme positions of the treble control. The attenuation of the two circuits is approximately the same at 1000 cycles. The treble “boost” circuit is similar to the crystal-equalizing network shown in Fig. 35. In the treble “cut” circuit, the parallel RC elements serve to attenuate the signal voltage further because the capacitor bypasses the resistance across the output. The effect of the capacitor is negligible at low frequencies; beyond 1000 cycles, the signal voltage is attenuated at a maximum rate of 6 db per octave.

![Diagram of tone-control network](image)

**Fig. 37**

The location of a tone-control network is of considerable importance. In a typical radio receiver, it may be inserted in the plate circuit of the power tube, the coupling circuit between the first af amplifier tube and the power tube, or the grid circuit of the first tube. In an amplifier using a beam power tube or pentode power amplifier without negative feedback, it is desirable to connect a resistance-capacitance filter across the primary of the output transformer. This filter may be fixed, with a supplemen-
tary tone control elsewhere, or it may form the tone control itself. If the amplifier incorporates negative feedback, the tone control may be inserted in the feedback network or else should be connected to a part of the amplifier which is external to the feedback loop. The over-all gain of a well designed tone-control network should be approximately unity.

**Limiters**

An amplifier may also be used as a limiter. One use of a limiter is in receivers designed for the reception of frequency-modulated signals. The limiter in FM receivers has the function of eliminating amplitude variations from the input to the detector. Because in an FM system amplitude variations are primarily the result of noise disturbances, the use of a limiter prevents such disturbances from being reproduced in the audio output. The limiter usually follows the last if stage so that it can minimize the effects of disturbances coming in on the rf carrier and those produced locally.

The limiter is essentially an if voltage amplifier designed for saturated operation. Saturated operation means that an increase in signal voltage above a certain value produces very little increase in plate current. A signal voltage which is never less than sufficient to cause saturation of the limiter, even on weak signals, is supplied to the limiter input by the preceding stages. Any change in amplitude, therefore, such as might be produced by noise voltage fluctuation, is not reproduced in the limiter output. The limiting action, of course, does not interfere with the reproduction of frequency variations.

Plate-current saturation of the limiter may be obtained by the use of grid-No.1-resistor-and-capacitor bias with plate and grid-No.2 voltages which are low compared with customary if-amplifier operating conditions.

As a result of these design features, the limiter is able to maintain its output voltage at a constant amplitude over a wide range of input-signal voltage variations. The output of the limiter is frequency-modulated if voltage, the mean frequency of which is that of the if amplifier. This voltage is impressed on the input of the detector.

The reception of FM signals without serious distortion requires that the response of the receiver be such that satisfactory amplification of the signal is provided over the entire range of frequency deviation from the mean frequency. Since the frequency at any instant depends on the modulation at that instant, it follows that excessive attenuation toward the edges of the band, in the rf or if stages, will cause distortion. In a high-fidelity receiver, therefore, the amplifiers must be capable of amplifying, for the maximum permissible frequency deviation of 75 kilocycles, a band 150 kilocycles wide. Suitable tubes for this purpose are the 6BA6 and 6BJ6.

**Television RF Amplifiers**

All amplifier stages generate a certain amount of noise as a result of thermal agitation of electrons in resistors or other components, minute variations in the cathode emission of tubes (shot effect), and minute grid currents in the amplifier tubes. In a radio or television receiver, noise generated in the first amplifier stage is often the controlling factor in determining the over-all sensitivity of the receiver. The "front end" of a receiver, therefore, is designed with special attention to both gain and noise characteristics.

Tuner input circuits of vhf television receivers use either a triode or a pentode in the rf amplifier stage. Such stages are required to amplify signals ranging from 55 to 216 Mc and having a bandwidth of 4.5 Mc, although the tuner is usually aligned for a bandwidth of 6 Mc to assure complete coverage of the band. In the early rf tuners, pentodes rather than triodes were used because the grid-plate capacitance of triodes created stability problems. In a direct-coupled cathode-drive circuit, however, the stable operation previously obtained only with pentode amplifiers can be combined with the low-noise characteristics of triodes.

In such circuits, one triode unit of a high-gain twin triode such as the 6BQ7-A or 6BZ7 is used as the direct-coupled driver for the other unit. The relatively high transconductance of these tubes permits high gain and low equivalent noise resistance. These tubes also
provide high input impedance which aids in obtaining high input-circuit gain over the vhf television broadcast range. The twin-triode circuit permits better isolation between the antenna circuit and the oscillator stage than a pentode amplifier circuit.

The gain of the rf amplifier stage is improved in the upper vhf range by use of a series inductance between the plate of the first triode unit and the cathode of the second triode unit of the 6BQ7-A or 6BZ7. This inductance resonates in series with the total (tube plus stray) capacitance between the cathode of the second triode unit and ground. The value of series inductance is chosen so that the resonance occurs above the upper end of the vhf broadcast range. The use of this series resonant circuit minimizes feedback of rf voltage from the plate of the first triode unit to the input grid. In the lower vhf range, the effect of the series resonant circuit is negligible. This circuit has a sufficiently broad frequency response to permit the use of fixed components.

The direct coupling between the two triode units of the 6BQ7-A or 6BZ7 causes the voltage between plate and cathode to increase when a bias voltage is applied to the first triode unit, thereby extending the tube's cutoff characteristic. This extension minimizes cross-modulation when automatic gain control (agc) bias is applied to the grid of the first triode unit.

For most effective gain control over a wide range of input levels, however, it is desirable to allow the bias of the second triode unit also to vary somewhat with signal level. Consequently, the grid of the second triode unit is connected to a tap on a dc voltage divider between the plate of the second triode unit and a fixed voltage source. When the input signal is strong, the application of agc bias to the grid of the first triode unit increases the total voltage drop across the tube and produces a higher positive potential on the direct-coupled cathode of the second triode unit. The grid of the second triode unit, however, is prevented from following the cathode potential completely because of the voltage-divider connection to the fixed-potentialsource. Therefore, the grid bias developed in the second triode unit depends on the ratio between the voltage-divider connection and the plate potential of the input triode. The values of the fixed-potential source and the voltage-divider resistors are chosen so that the stage has a suitable gain characteristic over a wide range of input-signal levels.

**Video Amplifiers**

The video amplifier stage in a television receiver usually employs a pentode-type tube specially designed to amplify the wide band of frequencies contained in the video signal and, at the same time, to provide high gain per stage. Pentodes are more useful than triodes in such stages because they have high transconductance (to provide high gain) together with low input and output interelectrode capacitances (to permit the broadband requirements to be satisfied). An approximate "figure of merit" for a particular tube for this application can be determined from the ratio of its transconductance, $g_m$, to the sum of its input and output capacitances, $C_{in}$ and $C_{out}$, as follows:

$\text{Figure of Merit} = \frac{g_m}{C_{in} + C_{out}}$

Typical values for this figure are in the order of $500 \times 10^6$ or greater.

A typical video amplifier stage, such as that shown in Fig. 40, is connected between the second detector of the television receiver and the picture tube. The contrast control, $R_c$, in this circuit controls the gain of the video amplifier tube. The inductance, $L_1$, in series with the load resistor, $R_L$, maintains the plate load impedance at a relatively constant value with increasing frequency. The inductance $L_1$ isolates the output capacitance of the tube so
that only stray capacitance is placed across the load. As a result, a highervalue load resistor is used to provide higher gain without affecting frequency response or phase relations. The decoupling circuit, C1R1, is used to improve the low-frequency response. Tubes used as video amplifiers include types 6CL6 and 12BY7-A, or the pentode sections of types 6AWS-A and 6AN8.

The luminance amplifier in a color-television receiver is a conventional video amplifier having a bandwidth of approximately 3.5 Mc. In a color receiver, the portion of the output of the second detector which lies within the frequency band from approximately 2.4 to 4.5 Mc is fed to a bandpass amplifier, as shown in the block diagram in Fig. 41. The color synchronizing signal, or “burst,” contained in this signal may then be fed to a “burst-keyer” tube. At the same time, a delayed horizontal pulse may be applied to the keyer tube. The output of the keyer tube is applied to the burst amplifier tube and the signal is then fed to the 3.58-Mc oscillator and to the “color-killer” stage.

The color killer applies a bias voltage to the bandpass amplifier in the absence of burst so that the color section, or chrominance channel, of the receiver remains inoperative during black-and-white broadcasts. A threshold control varies the bias and controls the burst level at which the killer stage operates.

The output of the 3.58-Mc oscillator and the output of the bandpass amplifier are fed into phase and amplitude demodulator circuits. The output of each demodulator circuit is an electrical representation of a color-difference signal, i.e., an actual color signal minus the black-and-white, or luminance, signal. The two color-difference signals are combined to produce the third color-difference signal; each of the three signals then represents one of the primary colors.

The three color-difference signals are usually applied to the grids of the three electron guns of the color picture tube, in which case the black-and-white signal from the luminance amplifier may be applied simultaneously to the cathodes. The chrominance and luminance signals then combine to produce the color picture. In the absence of transmitted color information, the chrominance channel is cut off by the color killer, as described above, and only the luminance signal is applied to the picture tube, producing a black-and-white picture.

**Television Sync Circuits**

In addition to picture information, the composite video signal supplied to a television receiver contains information to assure that the picture produced on the receiver is synchronized with the picture being viewed by the camera or pickup tube. The “sync” pulses, which have a greater amplitude than the video signal, trigger the scanning generators of the receiver when the electron beam of the pickup tube ends each trace.

The sync pulses in the composite video signal may be separated from the video information in the output of the second or video detector by means of the triode circuit shown in Fig. 42. In this circuit, the time constant of the network R1C1 is long with respect to the interval between pulses. During each pulse, the grid is driven positive and draws cur-
current, thereby charging capacitor C. Consequently, the grid develops a bias which is slightly greater than the cutoff voltage of the tube. Because plate current flows only during the sync-pulse period, only the amplified pulse appears in the output. This sync-separator stage discriminates against the video information. Because the bias developed on the grid is proportional to the strength of the incoming signal, the circuit also has the advantage of being relatively independent of signal fluctuations.

Because the electron beam scans the face of the picture tube at different rates in the vertical and horizontal directions, the receiver incorporates two different scanning generators. The repetition rate of the vertical generator is 60 cycles per second, and the rate of the horizontal generator is approximately 15,750 cycles per second. The composite video signal includes information which enables each generator to derive its correct triggering. One horizontal sync pulse is supplied at the end of each horizontal line scan. At the end of each frame, several pulses of longer duration than the horizontal sync pulses are supplied to actuate the vertical generator. The vertical information is separated from the horizontal information by differentiating and integrating circuits.

Rectification

The rectifying action of a diode finds important applications in supplying a receiver with dc power from an ac line and in supplying high dc voltage from a high-voltage pulse. A typical arrangement for converting ac to dc includes a rectifier tube, a filter, and a voltage divider. The rectifying action of the tube is explained briefly under Diodes, in the ELECTRONS, ELECTRODES, AND ELECTRON TUBE SECTION. High-voltage pulse rectification is described later under Horizontal Output Circuits.

The function of a filter is to smooth out the ripple of the tube output, as indicated in Fig. 43, and to increase rectifier efficiency. The action of the filter is explained in ELECTRON TUBE INSTALLATION SECTION under Filters. The voltage divider is used to cut down the output voltage to the values required by the plates and the other electrodes of the tubes in the receiver.

A half-wave rectifier and a full-wave rectifier circuit are shown in Fig. 44. In the half-wave circuit, current flows through the rectifier tube to the filter on every other half-cycle of the ac input voltage when the plate is positive with respect to the cathode. In the full-wave circuit, current flows to the filter on every half-cycle, through plate No. 1 on one half-cycle when plate No. 1 is positive with respect to the cathode, and through plate No. 2 on the next half-cycle when plate No. 2 is positive with respect to the cathode.
Because the current flow to the filter is more uniform in the full-wave circuit than in the half-wave circuit, the output of the full-wave circuit requires less filtering. Rectifier operating information and circuits are given under each rectifier tube type and in the CIRCUIT SECTION, respectively.

**Parallel operation** of rectifier tubes furnishes an output current greater than that obtainable with the use of one tube. For example, when two full-wave rectifier tubes are connected in parallel, the plates of each tube are connected together and each tube acts as a half-wave rectifier. The allowable voltage and load conditions per tube are the same as for full-wave service but the total load-handling capability of the complete rectifier is approximately doubled.

When mercury-vapor rectifier tubes are connected in parallel, a stabilizing resistor of 50 to 100 ohms should be connected in series with each plate lead in order that each tube will carry an equal share of the load. The value of the resistor to be used will depend on the amount of plate current that passes through the rectifier. Low plate current requires a high value; high plate current, a low value. When the plates of mercury-vapor rectifier tubes are connected in parallel, the corresponding filament leads should be similarly connected. Otherwise, the tube drops will be considerably unbalanced and larger stabilizing resistors will be required.

Two or more vacuum rectifier tubes can also be connected in parallel to give correspondingly higher output current and, as a result of paralleling their internal resistances, give somewhat increased voltage output. With vacuum types, stabilizing resistors may or may not be necessary depending on the tube type and the circuit.

A **voltage-doubler** circuit of simple form is shown in Fig. 45. The circuit derives its name from the fact that its dc voltage output can be as high as twice the peak value of ac input. Basically, a voltage doubler is a rectifier circuit arranged so that the output voltages of two half-wave rectifiers are in series.

The action of a voltage doubler can be described briefly as follows. On the positive half-cycle of the ac input, that

![Fig. 45](image_url)

is, when the upper side of the ac input line is positive with respect to the lower side, the upper diode passes current and feeds a positive charge into the upper capacitor. As positive charge accumulates on the upper plate of the capacitor, a positive voltage builds up across the capacitor. On the next half-cycle of the ac input, when the upper side of the line is negative with respect to the lower side, the lower diode passes current so that a negative voltage builds up across the lower capacitor.

So long as no current is drawn at the output terminals from the capacitor, each capacitor can charge up to a voltage of magnitude $E$, the peak value of the ac input. It can be seen from the diagram that with a voltage of $+E$ on one capacitor and $-E$ on the other, the total voltage across the capacitors is $2E$. Thus the voltage doubler supplies a no-load dc output voltage twice as large as the peak ac input voltage. When current is drawn at the output terminals by the load, the output voltage drops below $2E$ by an amount that depends on the magnitude of the load current and the capacitance of the capacitors. The arrangement shown in Fig. 45 is called a full-wave voltage doubler because each rectifier passes current to the load on each half of the ac input cycle.

Two rectifier types especially designed for use as voltage doublers are the 2526 and 117Z6-GT. These tubes combine two separate diodes in one tube. As voltage doublers, the tubes are used in “transformerless” receivers. In these receivers, the heaters of all tubes in the set are connected in series with a voltage-dropping resistor across the line. The connections for the heater supply and the voltage-doubling circuit are shown in Figs. 46 and 47.

With the full-wave voltage-doubler circuit in Fig. 46, it will be noted that
the dc load circuit can not be connected to ground or to one side of the ac supply line. This circuit presents certain disadvantages when the heaters of all the tubes in the set are connected in series with a resistance across the ac line. Such a circuit arrangement may cause hum because of the high ac potential between the heaters and cathodes of the tubes.

The circuit in Fig. 47 overcomes this difficulty by making one side of the ac line common with the negative side of the dc load circuit. In this circuit, one half of the tube is used to charge a capacitor which, on the following half cycle, discharges in series with the line voltage through the other half of the tube. This circuit is called a half-wave voltage doubler because rectified current flows to the load only on alternate halves of the ac input cycle. The voltage regulation of this arrangement is somewhat poorer than that of the full-wave voltage doubler.

Detection

When speech, music, or video information is transmitted from a radio or television station, the station radiates a radio-frequency (rf) wave which is of either of two general types. In one type, the wave is said to be amplitude modulated when its frequency remains constant and the amplitude is varied. In the other type, the wave is said to be frequency modulated when its amplitude remains essentially constant but its frequency is varied.

The function of the receiver is to reproduce the original modulating wave from the modulated rf wave. The receiver stage in which this function is performed is called the demodulator or detector stage.

AM Detection

The effect of amplitude modulation on the waveform of the rf wave is shown in Fig. 48. There are three different basic circuits used for the detection of amplitude-modulated waves: the diode detector, the grid-bias detector, and the grid-resistor detector. These circuits are alike in that they eliminate, either partially or completely, alternate half-cycles of the rf wave. With alternate half-cycles removed, the audio variations of the other half-cycles can be amplified to drive headphones or a loudspeaker.

A diode-detector circuit is shown in Fig. 49. The action of this circuit when a modulated rf wave is applied is illustrated by Fig. 50. The rf voltage applied to the circuit is shown in light line; the output voltage across capacitor C is shown in heavy line.

Between points (a) and (b) on the first positive half-cycle of the applied rf voltage, capacitor C charges up to the peak value of the rf voltage. Then as the
applied rf voltage falls away from its peak value, the capacitor holds the cathode at a potential more positive than the voltage applied to the anode. The capacitor thus temporarily cuts off current through the diode. While the diode current is cut off, the capacitor discharges from (b) to (c) through the diode load resistor R.

When the rf voltage on the anode rises high enough to exceed the potential at which the capacitor holds the cathode, current flows again and the capacitor charges up to the peak value of the second positive half-cycle at (d). In this way, the voltage across the capacitor follows the peak value of the applied rf voltage and reproduces the af modulation.

The curve for voltage across the capacitor, as drawn in Fig. 50, is somewhat jagged. However, this jaggedness, which represents an rf component in the voltage across the capacitor, is exaggerated in the drawing. In an actual circuit the rf component of the voltage across the capacitor is negligible. Hence, when the voltage across the capacitor is amplified, the output of the amplifier reproduces the speech or music originating at the transmitting station.

Another way to describe the action of a diode detector is to consider the circuit as a half-wave rectifier. When the rf signal on the plate swings positive, the tube conducts and the rectified current flows through the load resistance R. Because the dc output voltage of a rectifier depends on the voltage of the ac input, the dc voltage across C varies in accordance with the amplitude of the rf carrier and thus reproduces the af signal. Capacitor C should be large enough to smooth out rf or if variations but should not be so large as to affect the audio variations. Two diodes can be connected in a circuit similar to a full-wave rectifier to give full-wave detection. However, in practice, the advantages of this connection generally do not justify the extra circuit complication.

The diode method of detection produces less distortion than other methods because the dynamic characteristics of a diode can be made more linear than those of other detectors. The disadvantages of a diode are that it does not amplify the signal, and that it draws current from the input circuit and therefore reduces the selectivity of the input circuit. However, because the diode method of detection produces less distortion and because it permits the use of simple avc circuits without the necessity for an additional voltage supply, the diode method of detection is most widely used in broadcast receivers.

A typical diode-detector circuit using a twin-diode triode tube is shown in Fig. 51. Both diodes are connected together. R1 is the diode load resistor. A portion of the af voltage developed across this resistor is applied to the triode grid through the volume control R3. In a typical circuit, resistor R5 may be tapped so that five-sixths of the total af voltage across R1 is applied to the volume control. This tapped connection reduces the af voltage output of the detector circuit slightly but it reduces audio distortion and improves the rf filtering.

DC bias for the triode section is provided by the cathode-bias resistor R4 and the audio bypass capacitor C3. The function of capacitor C2 is to block the
dc bias of the cathode from the grid. The function of capacitor \( C_1 \) is to bypass any rf voltage on the grid to cathode. A twin-diode pentode may also be used in this circuit. With a pentode, the af output should be resistance-coupled rather than transformer-coupled.

Another diode-detector circuit, called a diode-biased circuit, is shown in Fig. 52. In this circuit, the triode grid is connected directly to a tap on the diode load resistor. When an rf signal voltage is applied to the diode, the dc voltage at the tap supplies bias to the triode grid. When the rf signal is modulated, the af voltage at the tap is applied to the grid and is amplified by the triode.

The advantage of the circuit shown in Fig. 52 over the self-biased arrangement shown in Fig. 51 is that the diode-biased circuit does not employ a capacitor between the grid and the diode load resistor, and consequently does not produce as much distortion of a signal having a high percentage of modulation.

However, there are restrictions on the use of the diode-biased circuit. Because the bias voltage on the triode depends on the average amplitude of the rf voltage applied to the diode, the average amplitude of the voltage applied to the diode should be constant for all values of signal strength at the antenna. Otherwise there will be different values of bias on the triode grid for different signal strengths and the triode will produce distortion. Because there is no bias applied to the diode-biased triode when no rf voltage is applied to the diode, sufficient resistance should be included in the plate circuit of the triode to limit its zero-bias plate current to a safe value.

These restrictions mean, in practice, that the receiver should have a separate-channel automatic-volume-control (avc) system. With such an avc system, the average amplitude of the signal voltage applied to the diode can be held within very close limits for all values of signal strength at the antenna.

The tube used in a diode-biased circuit should be one which operates at a fairly large value of bias voltage. The variations in bias voltage are then a small percentage of the total bias and hence produce small distortion. Tubes taking a fairly large bias voltage are types such as the 6BF6 or 6SR7 having a medium-mu triode. Tube types having a high-mu triode or a pentode should not be used in a diode-biased circuit.

A grid-bias detector circuit is shown in Fig. 53. In this circuit, the grid is biased almost to cutoff, i.e., operated so that the plate current with zero signal is practically zero. The bias voltage can be obtained from a cathode-bias resistor, a C-battery, or a bleeder tap. Because of the high negative bias, only the positive half-cycles of the rf signal are amplified by the tube. The signal is, therefore, detected in the plate circuit. The advantages of this method of detection are that it amplifies the signal, besides detecting it, and that it does not draw current from the input circuit and therefore does not lower the selectivity of the input circuit.

The grid-resistor-and-capacitor method, illustrated by Fig. 54, is somewhat more sensitive than the grid-bias method and gives its best results on weak signals. In this circuit, there is no negative dc bias voltage applied to the grid. Hence, on the positive half-cycles of the rf signal, current flows from grid to cathode. The grid and cathode thus act as a diode detector, with the grid resistor as the diode load resistor and the grid capacitor as the rf bypass capacitor. The voltage across the capacitor then reproduces the af modulation in the
same manner as has been explained for the diode detector. This voltage appears between the grid and cathode and is therefore amplified in the plate circuit.

![Diode Detector Circuit](image)

The output voltage thus reproduces the original af signal.

In this detector circuit, the use of a high-resistance grid resistor increases selectivity and sensitivity. However, improved af response and stability are obtained with lower values of grid-circuit resistance. This detector circuit amplifies the signal, but draws current from the input circuit and therefore lowers the selectivity of the input circuit.

**FM Detection**

The effect of frequency modulation on the waveform of the rf wave is shown in Fig. 55. In this type of transmission,

- **Unmodulated RF Carrier**
- **AF Modulating Wave**
- **Frequency-modulated RF Wave**

![Frequency-modulated RF Wave](image)

the frequency of the rf wave deviates from a mean value, at an af rate depending on the modulation, by an amount that is determined in the transmitter and is proportional to the amplitude of the af modulation signal.

For this type of modulation, a detector is required to discriminate between deviations above and below the mean frequency and to translate those deviations into a voltage whose amplitude varies at audio frequencies. Since the deviations occur at an audio frequency, the process is one of demodulation, and the degree of frequency deviation determines the amplitude of the demodulated (af) voltage.

A simple circuit for converting frequency variations to amplitude variations is a circuit which is tuned so that the mean radio frequency is on one slope of its resonance characteristic, as at A of Fig. 56. With modulation, the frequency swings between B and C, and the voltage developed across the circuit varies at the modulating rate. In order that no distortion will be introduced in this circuit, the frequency swing must be restricted to the portion of the slope which is effectively straight. Since this portion is very short, the voltage developed is low. Because of these limitations, this circuit is not commonly used but it serves to illustrate the principle.

The faults of the simple circuit are overcome in a push-pull arrangement, sometimes called a discriminator circuit, such as that shown in Fig. 57. Because of the phase relationships between the primary and each half of the secondary of the input transformer (each half of the secondary is connected in series with the primary through capacitor C2), the rf voltages applied to the diodes become unequal as the rf signal swings from the resonant frequency in each direction.
Since the swing occurs at audio frequencies (determined by the af modulation), the voltage developed across the diode load resistors, $R_1$ and $R_2$ connected in series, varies at audio frequencies. The output voltage depends on the difference in amplitude of the voltages developed across $R_1$ and $R_2$. These voltages are equal and of opposite sign when the rf carrier is not modulated and the output is, therefore, zero. When modulation is applied, the output voltage varies as indicated in Fig. 58.

Because this type of FM detector is sensitive to amplitude variations in the rf carrier, a limiter stage is frequently used to remove most of the amplitude modulation from the carrier. (See Limiters under Amplification.)

Another form of detector for frequency-modulated waves is called a ratio detector. This FM detector, unlike the previous one which responds to a difference in voltage, responds only to changes in the ratio of the voltage across two diodes and is, therefore, insensitive to changes in the differences in the voltages due to amplitude modulation of the rf carrier.

The basic ratio detector is given in Fig. 59. The plate load for the final if of the transformer is practically the same as in the previous circuit and, therefore, the rf voltages applied to the diodes depend upon how much the rf signal swings from the resonant frequency in each direction. At this point the similarity ends.

Diode 1, $R_3$, and diode 2 complete a series circuit fed by the secondary of the transformer $T$. The two diodes are connected in series so that they conduct on the same rf half-cycle. The rectified current through $R_2$ causes a negative voltage to appear at the plate of diode 1. Because $C_5$ is large, this negative voltage at the plate of diode 1 remains constant even at the lowest audio frequencies to be reproduced.

The rectified voltage across $C_3$ is proportional to the voltage across diode 1, and the rectified voltage across $C_4$ is proportional to the voltage across diode 2. Since the voltages across the two diodes differ according to the instantaneous frequency of the carrier, the voltages across $C_3$ and $C_4$ differ proportionately, the voltage across $C_3$ being the larger of the two voltages at carrier frequencies below the intermediate frequency and the smaller at frequencies above the intermediate frequency.

Amplifier stage is the parallel resonant circuit consisting of $C_1$ and the primary transformer $T$. The tuning and coupling

These voltages across $C_3$ and $C_4$ are additive and their sum is fixed by the constant voltage across $C_6$. Therefore,
while the ratio of these voltages varies at an audio rate, their sum is always constant. The voltage across C₄ varies at an audio rate when a frequency-modulated rf carrier is applied to the ratio detector; this audio voltage is extracted and fed to the audio amplifier. For a complete circuit utilizing this type of detector, refer to the CIRCUIT SECTION.

**Automatic Volume or Gain Control**

The chief purposes of automatic volume control (avc) or automatic gain control (agc) in a radio or television receiver are to prevent fluctuations in loudspeaker volume or picture brightness when the audio or video signal at the antenna is fading in and out.

An automatic volume control circuit regulates the receiver rf and if gain so that this gain is less for a strong signal than for a weak signal. In this way, when the signal strength at the antenna changes, the avc circuit reduces the resultant change in the voltage output of the last if stage and consequently reduces the change in the speaker output volume.

The avc circuit reduces the rf and if gain for a strong signal usually by increasing the negative bias of the rf, if, and frequency-mixer stages when the signal increases. A simple avc circuit is shown in Fig. 60. On each positive half-cycle of the signal voltage, when the diode plate is positive with respect to the cathode, the diode passes current.

![Fig. 60](https://via.placeholder.com/150)

Because of the flow of diode current through R₁, there is a voltage drop across R₁ which makes the left end of R₁ negative with respect to ground. This voltage drop across R₁ is applied, through the filter R₂ and C, as negative bias on the grids of the preceding stages. When the signal strength at the antenna increases, therefore, the signal applied to the avc diode increases, the voltage drop across R₁ increases, the negative bias voltage applied to the rf and if stages increases, and the gain of the rf and if stages is decreased. Thus the increase in signal strength at the antenna does not produce as much increase in the output of the last if stage as it would produce without avc.

When the signal strength at the antenna decreases from a previous steady value, the avc circuit acts, of course, in the reverse direction, applying less negative bias, permitting the rf and if gain to increase, and thus reducing the decrease in the signal output of the last if stage. In this way, when the signal strength at the antenna changes, the avc circuit acts to reduce change in the output of the last if stage, and thus acts to reduce change in loudspeaker volume.

The filter, C and R₂, prevents the avc voltage from varying at audio frequency. The filter is necessary because the voltage drop across R₁ varies with the modulation of the carrier being received. If avc voltage were taken directly from R₁ without filtering, the audio variations in avc voltage would vary the receiver gain so as to smooth out the modulation of the carrier. To avoid this effect, the avc voltage is taken from the capacitor C. Because of the resistance R₁ in series with C, the capacitor C can charge and discharge at only a comparatively slow rate. The avc voltage therefore cannot vary at frequencies as high as the audio range but can vary at frequencies high enough to compensate for most fading. Thus the filter permits the avc circuit to smooth out variations in signal due to fading, but prevents the circuit from smoothing out audio modulation.

It will be seen that an avc circuit and a diode-detector circuit are much alike. It is therefore convenient in a receiver to combine the detector and the avc diode in a single stage. Examples of how these functions are combined in receivers are shown in CIRCUIT SECTION.

In the circuit shown in Fig. 60, a certain amount of avc negative bias is applied to the preceding stages on a weak signal. Since it may be desirable to maintain the receiver rf and if gain
at the maximum possible value for a weak signal, avc circuits are designed in some cases to apply no avc bias until the signal strength exceeds a certain value. These avc circuits are known as delayed avc or davic circuits.

A davic circuit is shown in Fig. 61. In this circuit, the diode section D1 of the 6H6 acts as detector and avc diode. R1 is the diode load resistor and R2 and C2 are the avc filter. Because the cathode of diode D2 is returned through a fixed supply of -3 volts to the cathode of D1, a dc current flows through R1 and R2 in series with D2. The voltage drop caused by this current places the avc lead at approximately -3 volts (less the negligible drop through D2). When the average amplitude of the rectified signal developed across R1 does not exceed 3 volts, the avc lead remains at -3 volts. Hence, for signals not strong enough to develop 3 volts across R1, the bias applied to the controlled tubes stays constant at a value giving high sensitivity.

However, when the average amplitude of rectified signal voltage across R1 exceeds 3 volts, the plate of diode D2 becomes more negative than the cathode of D2 and current flow in diode D2 ceases. The potential of the avc lead is then controlled by the voltage developed across R1. Therefore, with further increase in signal strength, the avc circuit applies an increasing avc bias voltage to the controlled stages. In this way, the circuit regulates the receiver gain for strong signals, but permits the gain to stay constant at a maximum value for weak signals.

It can be seen in Fig. 61 that a portion of the -3 volts delay voltage is applied to the plate of the detector diode D1, this portion being approximately equal to R1/(R1 + R2) times -3 volts. Hence, with the circuit constants as shown, the detector plate is made negative with respect to its cathode by approximately one-half volt. However, this voltage does not interfere with detection because it is not large enough to prevent current flow in the tube.

Automatic gain control (agc) compensates for fluctuations in rf picture carrier amplitude. The peak carrier level rather than the average carrier level is controlled by the agc voltage because the peaks of the sync pulses are fixed when inserted on a fixed carrier level. The peak carrier level may be determined by measurement of the peaks of the sync pulses at the output of the video detector.

A conventional agc circuit, such as that shown in Fig. 62, consists of a diode detector circuit and an RC filter. The time constant of the detector circuit is made large enough to prevent the picture content from influencing the magnitude of the agc voltage. The output voltage (agc voltage) is equal to the peak value of the incoming signal.

The diode detector receives the incoming signal from the last if stage of the television receiver through the capacitor C2. The resistor R1 provides the load for the diode. The diode conducts only when its plate is driven positive with respect to its cathode. Electrons then flow from the cathode to the plate and thence into capacitor C1, where the negative charge is stored. Because of the low impedance offered by the diode during conduction, C1 charges up to the value of the peak applied voltage.

During the negative excursion of the signal, the diode does not conduct, and C1 discharges through resistor R1. Because of the large time constant of R1C1, however, only a small percentage of the voltage across C1 is lost during the interval between horizontal sync pulses.
During succeeding positive cycles, the incoming signal must overcome the negative charge stored in \( C_1 \) before the diode conducts, and plate current flows only at the peak of each positive cycle. The voltage across \( C_1 \), therefore, is determined by the level of the peaks of the positive cycles, or the sync pulses.

The negative voltage developed across resistor \( R_1 \) by the sync pulses is filtered by resistor \( R_2 \) and capacitor \( C_2 \) to remove the 15,750-cycle ripple of the horizontal sync pulse. The dc output is then fed to the if and rf amplifiers as an agc voltage.

This agc system may be expanded to include amplification of the agc signal before detection of the peak level, or amplification of the dc output, or both. A direct-coupled amplifier must be used for amplification of the dc signal. The addition of amplification makes the system more sensitive to changes in carrier level.

A "keyed" agc system such as that shown in Fig. 63 is used to eliminate flutter and to improve noise immunity in weak signal areas. This system provides more rapid action than the conventional agc circuits because the filter circuit can employ lower capacitance and resistance values.

In the keyed agc system, the negative output of the video detector is fed directly to the grid No.1 of the first video amplifier. The positive output of the video amplifier is, in turn, fed directly to the grid No.1 of the keyed agc amplifier. The video stage increases the gain of the agc system and, in addition, provides noise clipping. The plate voltage for the agc amplifier is a positive pulse obtained from a small winding on the horizontal output transformer which is in phase with the horizontal sync pulse obtained from the video amplifier. The polarity of this pulse is such that the plate of the agc amplifier tube is positive during the retrace time. The tube is biased so that current flows only when the grid No.1 and the plate are driven positive simultaneously. The amount of current flow depends on the grid-No.1 potential during the pulse. These pulses are smoothed out in the RC network in the plate circuit (\( R_1 \), \( C_1 \)). Because the dc voltage developed across \( R_1 \) is negative, it is suitable for application to the grids of the rf and if tubes as an agc voltage.

**Tuning Indication With Electron-Ray Tubes**

Electron-ray tubes are designed to indicate visually by means of a fluorescent target the effects of a change in controlling voltage. One application of them is as tuning indicators in radio receivers. Types such as the 6U5, 6E6, and the 6AB5/6N5 contain two main parts: (1) a triode which operates as a dc amplifier and (2) an electron-ray indicator which is located in the bulb as shown in Fig. 64. The target is operated at a positive voltage and, therefore, attracts electrons from the cathode. When the electrons strike the target they produce a glow on the fluorescent coating of the target. Under these conditions, the target appears as a ring of light.

A ray-control electrode is mounted between the cathode and target. When the potential of this electrode is less positive than the target, electrons flowing to the target are repelled by the electrostatic field of the electrode, and do not reach that portion of the target behind the electrode. Because the target does not glow where it is shielded from electrons, the control electrode casts a
shadow on the glowing target. The extent of this shadow varies from approximately 100° of the target when the control electrode is much more negative than the target to 0° when the control electrode is at approximately the same potential as the target.

In the application of the electron-ray tube, the potential of the control electrode is determined by the voltage on the grid of the triode section, as can be seen in Fig. 65. The flow of the triode plate current through resistor R produces a voltage drop which determines the potential of the control electrode. When the voltage of the triode grid changes in the positive direction, plate current increases, the potential of the control electrode goes down because of the increased drop across R, and the shadow angle widens. When the potential of the triode grid changes in the negative direction, the shadow angle narrows.

Another type of indicator tube is the 6AF6-G. This tube contains only an indicator unit but employs two ray-control electrodes mounted on opposite sides of the cathode and connected to individual base pins. It employs an external dc amplifier. (See Fig. 66.) Thus, two symmetrically opposite shadow angles may be obtained by connecting the two ray-control electrodes together; or, two unlike patterns may be obtained by individual connection of each ray-control electrode to its respective amplifier.

In radio receivers, avc voltage is applied to the grid of the dc amplifier. Because avc voltage is at maximum when the set is tuned to give maximum response to a station, the shadow angle is at minimum when the receiver is tuned to resonance with the desired station.

The choice between electron-ray tubes depends on the avc characteristic of the receiver. The 6E5 contains a sharp-cutoff triode which closes the shadow angle on a comparatively low value of avc voltage. The 6AB5/6N5 and 6U5 each have a remote-cutoff triode which closes the shadow on a larger value of avc voltage than the 6E5. The 6AF6-G may be used in conjunction with dc amplifier tubes having either remote- or sharp-cutoff characteristics.

Oscillation

As an oscillator, an electron tube can be employed to generate a continuously alternating voltage. In present-day radio broadcast receivers, this application is limited practically to superheterodyne receivers for supplying the heterodyning frequency. Several circuits (represented in Figs. 67 and 68) may be utilized, but they all depend on feeding more energy from the plate circuit to the grid circuit than is required to equal the power loss in the grid circuit. Feedback may be produced by electrostatic or electromagnetic coupling between the grid and plate circuits. When sufficient energy is fed back to more than compen-
sate for the loss in the grid circuit, the tube will oscillate. The action consists of regular surges of power between the plate and the grid circuit at a frequency dependent on the circuit constants of inductance and capacitance. By proper choice of these values, the frequency may be adjusted over a very wide range.

**Multivibrators**

Relaxation oscillators, which are widely used in present-day electronic equipment, are used to produce non-sinusoidal waveshapes such as rectangular and sawtooth pulses. Probably the most common relaxation oscillator is the multivibrator, which may be considered as a two-stage resistance-coupled amplifier in which the output of each tube is coupled into the input of the other tube.

Fig. 69 is a basic multivibrator circuit of the free-running type. In this circuit, oscillations are maintained by the alternate shifting of conduction from one tube to the other. The cycle usually starts with one tube, \( V_1 \), at zero bias, and the other, \( V_3 \), at cutoff or beyond. At this point, the capacitor \( C_1 \) is charged sufficiently to cut off \( V_3 \). \( C_1 \) then begins to discharge through the resistor \( R_1 \), and the voltage on the grid of \( V_3 \) rises until \( V_3 \) begins to conduct. The voltage on the plate of \( V_1 \) then decreases, causing \( V_1 \) to conduct less and less. At the same time, the plate voltage of \( V_1 \) begins to rise, causing \( V_3 \) to conduct still more heavily. Because of the amplification, this cumulative effect builds up extremely fast, and conduction switches from \( V_1 \) to \( V_3 \) within a few microseconds, depending on the circuit components.

In this circuit, therefore, conduction switches from \( V_1 \) to \( V_3 \) over the interval during which \( C_1 \) discharges from the voltage across \( R_1 \) to the cutoff voltage for \( V_3 \). The actual transfer of conduction does not occur until cutoff is reached. Conduction switches back to \( V_1 \) through a similar process to complete the cycle. The plate waveform is essentially rectangular in shape, and may be adjusted as to symmetry, frequency, and amplitude by proper choice of circuit constants, tubes, and voltages.

Although this type of multivibrator is free-running, it may be triggered by pulses of a given amplitude and frequency to provide a frequency-stabilized output. Multivibrator circuits may also be designed so that they are not free-running, but must be triggered externally to shift conduction from one tube to the other. Depending on the type of circuit, conduction may shift back to the first tube after a given time interval, or the second tube may continue conducting until another trigger signal is applied.

**Synchroguide Circuits**

The “synchroguide” is a controlled type of oscillator used in television receivers to generate and control the synchronized sawtooth voltage necessary for adequate line- or horizontal-frequency scanning. A simplified synchroguide circuit is shown in Fig. 70. This circuit provides stable, noise-free control of a blocking oscillator which generates a horizontal-frequency signal. It permits comparison of the received sync pulses and the generated sawtooth voltages so that properly locked-in horizontal scanning results.

The triode \( V_1 \) in Fig. 70 is a conventional blocking oscillator which enables a sawtooth voltage to be developed across the capacitor \( C_2 \). A portion of this sawtooth is fed back to the grid of the control tube, \( V_1 \). The positive sync pulses
are also applied to the grid of \( V_1 \). The waveforms shown in Fig. 71 illustrate the sawtooth and sync pulses (A and B) and their proper "in-sync" combination (C). The sync pulse occurs partly during the portion of the sawtooth voltage in which the triode \( V_1 \) draws current. Any shift in sync pulse as it is superimposed on the sawtooth, therefore, will affect the amount of conduction of the control tube. A change in control-tube conduction ultimately affects the bias on the oscillator-tube grid by changing the voltage to which the capacitor \( C_1 \) in the cathode circuit may charge. An increase in the positive bias increases the frequency of oscillation.

For example, waveform D in Fig. 71 illustrates a condition in which the sawtooth voltage is advanced in phase with respect to the sync-pulses. The widening of the pulse which occurs at the corner of the sawtooth waveform allows the control tube to conduct more current and, consequently, allows the capacitor \( C_1 \) to charge to a higher voltage. This increased reference voltage is, in turn, fed to the oscillator (\( V_3 \)) grid through the voltage divider (\( R_1, R_2 \)) and increases the positive bias. The increased bias then speeds up the frequency of oscillations until proper synchronization results.

**Deflection Circuits**

**Vertical Output Circuits**

A modified multivibrator in which the vertical output tube is part of the oscillator circuit is used in the vertical deflection stage of many television receivers. This stage supplies the deflection energy required for vertical deflection of the picture-tube beam. A simplified combined vertical-oscillator-output stage is shown in Fig. 72. Waveshapes at critical points of the circuit are included to illustrate the development of the desired current through the vertical output transformer and deflecting yoke.

The current waveform through the deflecting yoke and output transformer should be a sawtooth to provide the desired deflection. The grid and plate voltage waveforms of the output tube could also be sawtooth except for the effect of the inductive components in the yoke and transformer. The effect of these inductive components must be taken into consideration, however, particularly during retrace. The fast rate of current change during retrace time (which is approximately 1/15 as long as trace time) causes a high-voltage pulse at the plate which could give a trapezoidal waveshape to the plate voltage and cause increased plate current, excess damping, and lengthened retrace time. However, the grid voltage is made sufficiently negative during retrace to keep the tube close to cutoff, as described.
The frequency, and the relative deviation of the positive and negative portions of each cycle, are dependent on the values of resistors R1 and R2 and the RC combination R3C2, as explained previously in the section on multivibrators. The desired trapezoidal waveshape at the grid of V1 is created by capacitor C1, and resistor R2. If R2 were equal to zero, C1 would cause the grid-voltage waveshape to take the form shown in Fig. 73(a). When R2 is sufficiently large, C1 does not discharge completely when V1 conducts. When V1 is cut off, therefore, the voltage on the grid of V2 immediately rises to the voltage across C1. The resulting waveshape is shown in Fig. 73(b). The negative-going pulse of the grid-voltage waveshape prevents the high plate pulse from causing excess conduction, and thereby prevents over-damping.

This vertical deflection stage utilizes twin-triode tubes such as the 12BH7 and 6CM7. The 6CM7 is particularly suitable for this application because it incorporates dissimilar units to provide for the different operating requirements of the oscillator and output sections.

**Horizontal Output Circuits**

Fig. 74 shows a typical horizontal-output-and-deflection circuit used in television receivers. In addition to supplying the deflection energy required for horizontal deflection of the picture-tube beam, this circuit provides the high dc voltage required for the ultor of the picture tube and the "boosted" B voltage for other portions of the receiver. The horizontal-output tube is usually a beam power tube such as the 6DQ6-A or 6CD6-GA.

In this circuit, a sawtooth voltage from the horizontal-oscillator tube is applied to the grid No.1 of the horizontal-output tube. When this voltage rises above the cutoff point of the output tube, the tube conducts a sawtooth of plate current which is fed through the autotransformer to the horizontal-deflecting yoke. At the end of the horizontal-scanning cycle, which lasts for 63.4 microseconds, the sawtooth voltage on the grid suddenly cuts off the output tube. This sudden change sets up an oscillation of about 50 to 70 Kc in the output circuit, which may be considered as an inductor shunted by the stray capacitance of the circuit. During the first half of this oscillation, a positive voltage appears across the transformer. In the second half of the cycle, the voltage swings below the plate supply voltage, and the damper diode conducts, damping out the oscillation. At the same time, the current through the deflecting yoke reverses and reaches its negative peak. As the damper-diode current decays exponentially to zero, the output tube begins to conduct again. The yoke current, therefore, is composed of current resulting from damper-diode conduction followed by output-tube conduction.

When the output tube is suddenly cut off, the high-voltage pulse produced by shock excitation of the load circuit is increased by means of an extra winding on the transformer. This high-voltage pulse charges a high-voltage capacitor through the high-voltage rectifier. The output of this circuit is the dc high-voltage supply for the picture tube. The high-voltage rectifier also obtains its filament power through a separate winding on the horizontal-output transformer.

Current flowing through the damper
diode charges the "boost" capacitor through the damper portion of the transformer winding. The polarity of the charge on the capacitor is such that the voltage at the low end of the winding is increased above the plate supply voltage, or B+. This higher voltage or "boost" is used for the output-tube plate supply, and may also supply the deflection oscillators and the vertical-output circuit provided the current drain is not excessive.

**High-Voltage Regulator Circuit**

In color-television receivers, it is very important to regulate the high-voltage supply to the picture tube. A suitable circuit using the 6BK4 for regulation of the output of a high-voltage, high-impedance supply is shown in Fig. 75. In this circuit, the cathode is held at a fixed positive potential with respect to ground.

Because the grid potential is kept slightly less positive by the voltage drop across resistor R2, the tube operates in the negative grid region and no grid current is drawn.

When the output voltage, e0, rises as a result of an increase in load current, a small fraction of the additional voltage is applied to the grid of the tube by the voltage-divider circuit consisting of R1 and R2. This increased grid voltage causes the tube to draw an increased current from the unregulated supply. The increased current, in turn, causes a voltage drop across the high internal impedance of the unregulated supply, Rs, which tends to counteract the original rise of the voltage. If desired, the grid may be connected to a variable point on the voltage divider to allow some adjustment of the output-voltage level.

The circuit shown in Fig. 75 compensates for both load-current and line-voltage variations. The output of a regulated 25,000-volt supply using this circuit does not drop more than 500 volts as the load current increases from 0 to 1 milliampere. Variations in output voltage may be kept within ±1 per cent for input-voltage changes of ±10 per cent. If desired, the compensation for input-voltage changes may be eliminated while compensation for load-current changes is maintained.

**Frequency Conversion**

Frequency conversion is used in superheterodyne receivers to change the frequency of the rf signal to an intermediate frequency. To perform this change in frequency, a frequency-converting device consisting of an oscillator and a frequency mixer is employed. In such a device, shown diagrammatically in Fig. 76, two voltages of different frequency, the rf signal voltage and the voltage generated by the oscillator, are applied to the input of the frequency mixer. These voltages beat, or heterodyne, within the mixer tube to produce a plate current having, in addition to the frequencies of the input voltages, numerous sum and difference frequencies.

The output circuit of the mixer stage is provided with a tuned circuit which is adjusted to select only one beat frequency, i.e., the frequency equal to the difference between the signal frequency and the oscillator frequency. The selected output frequency is known as the intermediate frequency, or if. The output frequency of the mixer tube is kept constant for all values of signal frequency by tuning the oscillator to the proper frequency.

Important advantages gained in a receiver by the conversion of signal frequency to a fixed intermediate frequency are high selectivity with few tuning stages and a high, as well as stable, overall gain for the receiver.

Several methods of frequency con-
version for superheterodyne receivers are of interest. These methods are alike in that they employ a frequency-mixer tube in which plate current is varied at a combination frequency of the signal frequency and the oscillator frequency. These variations in plate current produce across the tuned plate load a voltage of the desired intermediate frequency. The methods differ in the types of tubes employed and in the means of supply input voltages to the mixer tube.

A method widely used before the availability of tubes especially designed for frequency-conversion service and currently used in many FM, television, and standard broadcast receivers, employs as mixer tube either a triode, a tetrode, or a pentode, in which oscillator voltage and signal voltage are applied to the same grid. In this method, coupling between the oscillator and mixer circuits is obtained by means of inductance or capacitance.

A second method employs a tube having an oscillator and frequency mixer combined in the same envelope. In one form of such a tube, coupling between the two units is obtained by means of the electron stream within the tube. Because five grids are used, the tube is called a pentagrid converter.

Grids No. 1 and No. 2 and the cathode are connected to an external circuit to act as a triode oscillator. Grid No. 1 is the grid of the oscillator and grid No. 2 is the anode. These and the cathode can be considered as a composite cathode which supplies to the rest of the tube an electron stream that varies at the oscillator frequency.

This varying electron stream is further controlled by the rf signal voltage on grid No. 4. Thus, the variations in plate current are due to the combination of the oscillator and the signal frequencies. The purpose of grids No. 3 and No. 5, which are connected together within the tube, is to accelerate the electron stream and to shield grid No. 4 electrostatically from the other electrodes.

Pentagrid-converter tubes of this design are good frequency-converting devices at medium frequencies. However, their performance is better at the lower frequencies because the output of the oscillator drops off as the frequency is raised and because certain undesirable effects produced by interaction between oscillator and signal sections of the tube increase with frequency.

To minimize these effects, several of the pentagrid-converter tubes are designed so that no electrode functions alone as the oscillator anode. In these tubes, grid No. 1 functions as the oscillator grid, and grid No. 2 is connected within the tube to the screen grid (grid No. 4). The combined two grids, Nos. 2 and 4, shield the signal grid (grid No. 3) and act as the composite anode of the oscillator triode. Grid No. 5 acts as the suppressor grid.

Converter tubes of this type are designed so that the space charge around the cathode is unaffected by electrons from the signal grid. Furthermore, the electrostatic field of the signal grid also has little effect on the space charge. The result is that rf voltage on the signal grid produces little effect on the cathode current. There is, therefore, little detuning of the oscillator by avc bias because changes in avc bias produce little change in oscillator transconductance or in the input capacitance of grid No. 1.

Examples of the pentagrid converters discussed in the preceding paragraph are the single-ended types 1R5 and 6BE6. A schematic diagram illustrating the use of the 6BE6 with self-excitation is given in Fig. 77; the 6BE6 may also be used with separate excitation. A complete circuit is shown in the CIRCUIT SECTION.

Another method of frequency conversion utilizes a separate oscillator having its grid connected to the No. 1 grid of a mixer hexode. The cathode, triode grid, and triode plate form the oscillator.
unit of the tube. The cathode, hexode mixer grid (grid No. 1), hexode screen grids (grids Nos. 2 and 4), hexode signal grid (grid No. 3), and hexode plate constitute the mixer unit. The internal shields are connected to the shell of the tube and act as a suppressor grid for the hexode unit.

The action of this tube in converting a radio-frequency signal to an intermediate frequency depends on (1) the generation of a local frequency by the triode unit, (2) the transferring of this frequency to the hexode grid No. 1, and (3) the mixing in the hexode unit of this frequency with that of the rf signal applied to the hexode grid No. 3. The tube is not critical to changes in oscillator-plate voltage or signal-grid bias and, therefore, finds important use in all-wave receivers to minimize frequency-shift effects at the higher frequencies.

A further method of frequency conversion employs a tube called a penta-grid mixer. This type has two independent control grids and is used with a separate oscillator tube. RF signal voltage is applied to one of the control grids and oscillator voltage is applied to the other. It follows, therefore, that the variations in plate current are due to the combination of the oscillator and signal frequencies.

The tube contains a heater-cathode, five grids, and a plate. Grids Nos. 1 and 3 are control grids. The rf signal voltage is applied to grid No. 1. This grid has a remote-cutoff characteristic and is suited for control by avc bias voltage. The oscillator voltage is applied to grid No. 3. This grid has a sharp-cutoff characteristic and produces a comparatively large effect on plate current for a small amount of oscillator voltage. Grids Nos. 2 and 4 are connected together within the tube. They acerelate the electron stream and shield grid No. 3 electrostatically from the other electrodes. Grid No. 5, connected within the tube to the cathode, functions similarly to the suppressor grid in a pentode.

In the converter or mixer stage of a television receiver, stable oscillator operation is most readily obtained when separate tubes or tube sections are used for the oscillator and mixer functions. A typical television mixer-oscillator circuit is shown in Fig. 78. In such circuits, the oscillator voltage is applied to the mixer grid by inductive coupling, capacitive coupling, or a combination of the two.

![Fig. 78](image)

Tubes containing electrically independent oscillator and mixer units in the same envelope, such as the 6U8-A and 6X8, are designed especially for this application.

**Automatic Frequency Control**

An automatic frequency control (afc) circuit provides a means of correcting automatically the intermediate frequency of a superheterodyne receiver when, for any reason, it drifts from the frequency to which the if stages are tuned. This correction is made by adjusting the frequency of the oscillator. Such a circuit will automatically compensate for slight changes in rf carrier or oscillator frequency as well as for inaccurate manual or push-button tuning.

An afc system requires two sections: a frequency detector and a variable reactance. The detector section may be essentially the same as the FM detector illustrated in Fig. 57 and discussed under Detection. In the afc system, however, the output is a dc control voltage, the magnitude of which is proportional to the amount of frequency shift. This dc control voltage is used to control the grid bias of an electron tube which comprises the variable reactance section (Fig. 79).

![Fig. 79](image)
The plate current of the reactance tube is shunted across the oscillator tank circuit. Because the plate current and plate voltage of the reactance tube are almost 90° out of phase, the control tube affects the tank circuit in the same manner as a reactance. The grid bias of the tube determines the magnitude of the effective reactance and, consequently, a control of this grid bias can be used to control the oscillator frequency.

Automatic frequency control is also used in television receivers to keep the horizontal oscillator in step with the horizontal-scanning frequency (15,750 cps) at the transmitter. A widely used horizontal AFC circuit is shown in Fig. 80.

![Diagram](image)

This circuit, which is often referred to as a balanced-phase-detector or phase-discriminator circuit, is usually employed to control the frequency of a multivibrator-type horizontal-oscillator circuit. The 6AL5 detector supplies a dc control voltage to the grid of the horizontal-oscillator tube which counteracts changes in its operating frequency. The magnitude and polarity of the control voltages are determined by phase relationships in the AFC circuit at a given moment.

The horizontal sync pulses obtained from the sync-separator circuit are fed through a single-triode phase-inverter or phase-splitter circuit to the two diode units of the 6AL5. Because of the action of the phase-inverter circuit, the signals applied to the two diode units are equal in amplitude but 180 degrees out of phase. A reference sawtooth voltage obtained from the horizontal output circuit is also applied simultaneously to both units. Any change in the oscillator frequency alters the phase relationship between the reference sawtooth and the incoming horizontal sync pulses, causing one diode unit of the 6AL5 to conduct more heavily than the other, and thus producing a correction signal. The system remains balanced at all times, therefore, because momentary changes in oscillator frequency are instantaneously corrected by the action of the control voltage.

The diode units of the 6AL5 are biased so that conduction takes place only during the tips of the sync pulses. The relative position of the sync pulses on the retrace portion of the sawtooth waveform at any given instant determines which diode unit conducts more heavily, and thereby establishes the magnitude and polarity of the control voltage. The network between the diode units and the grid of the horizontal-oscillator tube is essentially a low-pass filter which prevents the horizontal sync pulses from affecting the horizontal-oscillator performance.
The installation of electron tubes requires care if high-quality performance is to be obtained from the associated circuits. Installation suggestions and precautions which are generally common to all types of tubes are covered in this section. Careful observance of these suggestions will do much to help the experimenter and electronic technician obtain the full performance capabilities of radio tubes and circuits. Additional pertinent information is given under each tube type and in the CIRCUIT SECTION.

Filament and Heater Power Supply

The design of electron tubes allows for some variation in the voltage and current supplied to the filament or heater, but most satisfactory results are obtained from operation at the rated values. When the voltage is low, the temperature of the cathode is below normal, with the result that electron emission is limited. The limited emission may cause unsatisfactory operation and reduced tube life. On the other hand, high cathode voltage may cause rapid vaporization of cathode material and shorten tube life.

To insure proper tube operation, it is important that the filament or heater voltage be checked at the socket terminals by means of a high-resistance voltmeter while the equipment is in operation. In the case of series operation of heaters or filaments, correct adjustment can be checked by means of an ammeter in the heater or filament circuit.

The filament or heater voltage supply may be a direct-current source (a battery or a dc power line) or an alternating-current power line, depending on the type of service and type of tube. Frequently, a resistor (either variable or fixed) is used with a dc supply to permit compensation for battery voltage variations or to adjust the tube voltage at the socket terminals to the correct value. Ordinarily, a step-down transformer is used with an ac supply to provide the proper filament or heater voltage. Receivers intended for operation on both dc and ac power lines have the heaters connected in series with a suitable resistor and supplied directly from the power line.

DC filament or heater operation should be considered on the basis of the source of power. In the case of the battery supply for the 1.4-volt filament tubes, it is unnecessary to use a voltage-dropping resistor in series with the filament and a single dry-cell; the filaments of these tubes are designed to operate satisfactorily over the range of voltage variations that normally occur during the life of a dry-cell. Likewise, no series resistor is required when the 1.25-volt filament subminiatures are operated from a single 1.5-volt flashlight-type dry-cell, when the 2-volt filament type tubes are operated from a single storage cell, or when the 6.3-volt series are operated from a 6-volt storage battery.

In the case of dry-battery supply for 2-volt filament tubes, a variable resistor in series with the filament and the battery is required to compensate for battery variations. Turning the set on and off by means of the rheostat is advised to prevent over-voltage conditions after an off-period because the voltage of dry-cells rises during off-periods.

In the case of storage-battery supply, air-cell-battery supply, or dc power supply, a non-adjustable resistor of suitable value may be used. It is well to check initial operating conditions, and thus the resistor value, by means of a voltmeter or ammeter.

The filament or heater resistor required when filaments and/or heaters are operated in parallel can be determined easily by a simple formula derived from Ohm’s law.

Required resistance (ohms) = \[
\frac{\text{supply volts} - \text{rated volts of tube type}}{\text{total rated filament current (amperes)}}
\]

Thus, if a receiver using two 6T4’s, one 1R5, one 1U5, and one 3V4 is to be operated from a storage battery, the series resistor is equal to 2 volts (the voltage from a single storage cell) minus 1.4 volts (voltage rating for these tubes) divided by 0.3 ampere (the sum of \(4 \times 0.06\) ampere + \(1 \times 0.1\) ampere), i.e., approximately 2 ohms. Since this resis-
tor should be variable to allow adjustment for battery depreciation, it is advisable to obtain the next larger commercial size, although any value between 2 and 3 ohms will be quite satisfactory.

Where much power is dissipated in the resistor, the wattage rating should be sufficiently large to prevent overheating. The power dissipation in watts is equal to the voltage drop in the resistor multiplied by the total filament current in amperes. Thus, for the example above, 0.6 \times 0.3 = 0.18\text{\,watt}. In this case, the value is so small that any commercial rheostat with suitable resistance will be adequate.

For the case where the heaters and/or filaments of several tubes are operated in series, the resistor value is calculated by the following formula, also derived from Ohm's law.

Required resistance (ohms) = \[
\frac{\text{supply volts} - \text{total rated volts of tubes}}{\text{rated amperes of tubes}}
\]

Thus, if a receiver having one 6BE6, one 6BA6, one 6AT6, one 25L6-GT, and one 25Z6-GT is to be operated from a 117-volt power line, the series resistor is equal to 117 volts (the supply voltage) minus 68.9 volts (the sum of 3 \times 6.3 volts + 2 \times 25 volts) divided by 0.3 amperes (current rating of the tubes), i.e., approximately 160 ohms. The wattage dissipation in the resistor will be 117 volts minus 68.9 volts times 0.3 amperes, or approximately 14.4 watts. A resistor having a wattage rating in excess of this value should be chosen.

When the series-heater connection is used in ac/dc receivers, it is usually advisable to arrange the heaters in the circuit so that the tubes most sensitive to hum disturbances are at or near the ground potential of the circuit. This arrangement reduces the amount of ac voltage between the heaters and cathodes of these tubes and minimizes the hum output of the receiver. The order of heater connection, by tube function, from chassis to the rectifier-cathode side of the ac line is shown in Fig. 81.

AC filament or heater operation should be considered on the basis of either a parallel or a series arrangement of filaments and/or heaters. In the case of the parallel arrangement, a step-down transformer is employed. Precautions should be taken to see that the line voltage is the same as that for which the primary of the transformer is designed. The line voltage may be determined by measurement with an ac voltmeter (0-150 volts).

If the line voltage measures in excess of that for which the transformer is designed, a resistor should be placed in series with the primary to reduce the line voltage to the rated value of the transformer primary. Unless this is done, the excess input voltage will cause proportionally excessive voltage to be applied to the tubes. Any electron tube may be damaged or made inoperative by excessive operating voltages.

If the line voltage is consistently below that for which the primary of the transformer is designed, it may be necessary to install a booster transformer between the ac outlet and the transformer primary. Before such a transformer is installed, the ac line fluctuations should be very carefully noted. Some radio sets are equipped with a line-voltage switch which permits adjustment of the power transformer primary to the line voltage. When this switch is properly adjusted, the series-resistor or booster-transformer method of controlling line voltage is seldom required.

In the case of the series arrangements of filaments and/or heaters, a voltage-dropping resistance in series with the heaters and the supply line is usually required. This resistance should be of such value that, for normal line voltage,
tubes will operate at their rated heater or filament current. The method for calculating the resistor value is given above.

When the filaments of battery-type tubes are connected in series, the total filament current is the sum of the current due to the filament supply and the plate and grid-No.2 currents (cathode current) returning to B(−) through the tube filaments. Consequently, in a series filament string it is necessary to add shunt resistors across each filament section to bypass this cathode current in order to maintain the filament voltage at its rated value.

**Heater-to-Cathode Connection**

The cathodes of heater-type tubes, when operated from ac, should be connected to the mid-tap on the heater supply winding, to the mid-tap of a 50-ohm (approximate) resistor shunted across the winding, or to one end of the heater supply winding depending on circuit requirements. If none of these methods is used, it is important to keep the heater-cathode voltage within the ratings given in the TUBE TYPES SECTION.

Hum from ac-operated heater tubes used in high-gain audio amplifiers may frequently be reduced to a negligible value by employing a 15- to 40-volt bias between the heater and cathode elements of the tubes. The bias should be connected so that the tube heater is positive with respect to its cathode. Such bias can be obtained from the regular plate-supply rectifier of the amplifier.

If a large resistor is used between heater and cathode, it should be bypassed by a suitable capacitor or objectionable hum may develop. The hum is due to the fact that even a minute pulsating leakage current flowing between the heater and cathode will develop a small voltage across any resistance in the circuit. This hum voltage is amplified by succeeding stages.

**Plate Voltage Supply**

The plate voltage for electron tubes is obtained from batteries, rectifiers, direct-current power lines, and small local generators. The maximum plate-voltage value for any tube type should not be exceeded if most satisfactory performance is to be obtained. Plate voltage should not be applied to a tube unless the corresponding recommended voltage is also supplied to the grid.

It is recommended that the primary circuit of the power transformer be fused to protect the rectifier tube(s), the power transformer, filter capacitor, and chokes in case a rectifier tube fails.

**Grid Voltage Supply**

The recommended grid voltages for different operating conditions have been carefully determined to give the most satisfactory performance. Grid voltage may be obtained from a fixed source such as a separate C-battery or a tap on the voltage divider of the high-voltage dc supply, from the voltage drop across a resistor in the cathode circuit, or from the voltage drop across a resistor in the grid circuit. The first method is called "fixed bias"; the second is called "cathode bias" or "self bias"; the third is called "grid-resistor bias" and is sometimes incorrectly referred to in receiving-tube practice as "zero-bias operation."

In any case, the object is to make the grid negative with respect to the cathode by the specified voltage. When a C-battery is used, the negative terminal is connected to the grid return and the positive terminal is connected to the negative filament socket terminal, or to the cathode terminal if the tube is of the heater-cathode type. If the filament is supplied with alternating current, this connection is usually made to the center-tap of a low resistance (20-50 ohms) shunted across the filament terminals. This method reduces hum disturbances caused by the ac supply. If bias voltages are obtained from the voltage divider of a high-voltage dc supply, the grid return is connected to a more negative tap than the cathode.

The cathode-biasing method utilizes the voltage drop produced by the cathode current flowing through a resistor connected between the cathode and the negative terminal of the B-supply. (See Fig. 82.) The cathode current is, of course, equal to the plate current in the case of a triode, or to the sum of the plate and grid-No.2 currents in the case of a tetrode, pentode, or beam power tube. Because the voltage drop along the resistance is increasingly nega-
tive with respect to the cathode, the required negative grid-bias voltage can be obtained by connecting the grid return to the negative end of the resistance.

The value of the resistance for cathode-biasing a single tube can be determined from the following formula:

\[
\text{Resistance (ohms)} = \frac{\text{desired grid-bias voltage} \times 1000}{\text{rated cathode current in milliamperes}}
\]

Thus, the resistance required to produce 9 volts bias for a triode which operates at 3 milliamperes plate current is \(9 \times 1000 / 3 = 3000\) ohms. If the cathode current of more than one tube passes through the resistor, or if the tube or tubes employ more than three electrodes, the total current determines the size of the resistor.

Bypassing of the cathode-bias resistor depends on circuit-design requirements. In rf circuits the cathode resistor usually is bypassed. In af circuits the use of an unbypassed resistor will reduce distortion by introducing degeneration into the circuit. However, the use of an unbypassed resistor decreases gain and power sensitivity. When bypassing is used, it is important that the bypass capacitor be sufficiently large to have negligible reactance at the lowest frequency to be amplified.

In the case of power-output tubes having high transconductance such as the beam power tubes, it may be necessary to shunt the bias resistor with a small mica capacitor (approximately 0.001 \(\mu\)f) in order to prevent oscillations. The usual af bypass may or may not be used, depending on whether or not degeneration is desired. In tubes having high values of transconductance, such as the 6BA6, 6CB6, and 6AC7, input capacitance and input conductance change appreciably with plate current. When such a tube having a separate suppressor-grid connection is used as an rf amplifier, these changes may be minimized by leaving a certain portion of the cathode-bias resistor unbypassed. In order to minimize feedback when this method is used, the external grid-No.1-to-plate (wiring) capacitances should be kept to a minimum, the grid No.2 should be bypassed to ac ground, and the grid No.3 should be connected to ac ground.

The use of a cathode resistor to obtain bias voltage is not recommended for amplifiers in which there is appreciable shift of electrode currents with the application of a signal. In such amplifiers, a separate fixed supply is recommended.

The grid-resistor biasing method is also a self-bias method because it utilizes the voltage drop across the grid resistor produced by small amounts of grid current flowing in the grid-cathode circuit. This current is due to (1) an electromotive potential difference between the materials comprising the grid and cathode and (2) grid rectification when the grid is driven positive. A large value of resistance is required in order to limit this current to a very small value and to avoid undesirable loading effects on the preceding stage.

Examples of this method of bias are given in circuits 19-1 and 19-4 in the CIRCUIT SECTION. In both of these circuits, the audio amplifier type 1U5 or 12AV6 has a 10-megohm resistor between the grid and the negative filament or cathode to furnish the required bias which is usually less than 1 volt. This method of biasing is used principally in the early voltage amplifier stages (usually employing high-mu triodes) of audio amplifier circuits, where the tube dissi-
A grid resistor is also used in many oscillator circuits for obtaining the required bias. In these circuits, the grid voltage is relatively constant and its magnitude is usually in the order of 5 volts or more. Consequently, the bias voltage is obtained only through grid rectification. A relatively low value of resistor, 0.1 megohm or less, is used. Oscillator circuits employing this method of bias are given in circuits 19-1 and 19-4 in the CIRCUIT SECTION.

Grid-bias variation for the rf and if amplifier stages is a convenient and frequently used method for controlling receiver volume. The variable voltage supplied to the grid may be obtained: (1) from a variable cathode resistor as shown in Figs. 83 and 84; (2) from a bleeder circuit by means of a potentiometer as shown in Fig. 85; or (3) from a bleeder circuit in which the bleeder current is varied by a tube used for automatic volume control. The latter circuit is shown in Fig. 60.

In all cases it is important that the control be arranged so that at no time will the bias be less than the recommended minimum grid-bias voltage for the particular tubes used. This requirement can be met by providing a fixed stop on the potentiometer, by connecting a fixed resistance in series with the variable resistance, or by connecting a fixed cathode resistance in series with the variable resistance used for regulation. Where receiver gain is controlled by grid-bias variation, it is advisable to have the control voltages extend over a wide range in order to minimize cross-modulation and modulation-distortion.

A remote-cutoff type of tube should, therefore, be used in the controlled stages.

In most tubes employing a unipotential cathode, a positive grid current begins to flow when the grid is slightly negative and increases rapidly as the grid is made more positive, as shown in Fig. 86. The value of grid voltage at which positive grid current starts to flow is generally referred to as contact potential. Contact potential is caused by the initial velocity of emission of electrons from the cathode and an electro-thermal effect due to the differences in temperature and in material composition of the grid and the cathode.

The value of the contact-potential voltage may be as high as 1½ volts. If the operating bias of the tube is less than the contact potential, it is found that two effects are present. Direct current flows in the grid circuit, and the dynamic input resistance of the tube may be relatively low. It is generally desir-
able to supply the tube with a value of bias sufficiently high so that the tube is not operating within the contact-potential region. When a tube must be operated within this region, care should be taken to avoid undesirable effects in the grid circuit due to grid current or low input resistance.

**Screen-Grid Voltage Supply**

The positive voltage for the screen grid (grid No.2) of screen-grid tubes may be obtained from a tap on a voltage divider, from a potentiometer, or from a series resistor connected to a high-voltage source, depending on the particular tube type and its application. The screen-grid voltage for tetrodes should be obtained from a voltage divider or a potentiometer rather than through a series resistor from a high-voltage source because of the characteristic screen-grid current variations of tetrodes. Fig. 87 shows a tetrode with its screen-grid voltage obtained from a potentiometer.

When pentodes or beam power tubes are operated under conditions where a large shift of plate and screen-grid currents does not take place with the application of the signal, the screen-grid voltage may be obtained through a series resistor from a high-voltage source. This method of supply is possible because of the high uniformity of the screen-grid current characteristic in pentodes and beam power tubes. Because the screen-grid voltage rises with increase in bias and resulting decrease in screen-grid current, the cutoff characteristic of a pentode is extended by this method of supply.

This method is sometimes used to increase the range of signals which can be handled by a pentode. When used in resistance-coupled amplifier circuits employing pentodes in combination with the cathode-biasing method, it minimizes the need for circuit adjustments. Fig. 88 shows a pentode with its screen-grid voltage supplied through a series resistor.

When power pentodes and beam power tubes are operated under conditions such that there is a large change in plate and screen-grid currents with the application of signal, the series-resistor method of obtaining screen-grid voltage should not be used. A change in screen-grid current appears as a change in the voltage drop across the series resistor in the screen-grid circuit; the result is a change in the power output and an increase in distortion. The screen-grid voltage should be obtained from a point in the plate-voltage-supply filter system having the correct voltage, or from a separate source.

It is important to note that the plate voltage of tetrodes, pentodes, and beam power tubes should be applied before or simultaneously with the screen-grid voltage. Otherwise, with voltage on the screen grid only, the screen-grid current may rise high enough to cause excessive screen-grid dissipation.

**Screen-grid voltage variation** for the rf amplifier stages has sometimes been used for volume control in older-type receivers. Reduced screen-grid voltage lowers the transconductance of the tube and results in reduced gain per stage. The voltage variation is obtained by means of a potentiometer shunted across the screen-grid voltage supply. (See Fig. 87.) When the screen-grid voltage is varied, it must never exceed the rating of the tube. This requirement can be met by providing a fixed stop on the potentiometer.

**Shielding**

In high-frequency stages having
high gain, the output circuit of each stage must be shielded from the input circuit of that stage. Each high-frequency stage also must be shielded from the other high-frequency stages. Unless shielding is employed, undesired feedback may occur and may produce many harmful effects on receiver performance.

To prevent this feedback, it is a desirable practice to shield separately each unit of the high-frequency stages. For instance, in a superheterodyne receiver, each if and rf coil may be mounted in a separate shield can. Baffle plates may be mounted on the ganged tuning capacitor to shield each section of the capacitor from the other section. The oscillator coil may be especially well shielded by being mounted under the chassis.

The shielding precautions required in a receiver depend on the design of the receiver and the layout of the parts. In all receivers having high-gain high-frequency stages, it is necessary to shield separately each tube in high-frequency stages. When metal tubes, and in particular the single-ended types, are used, complete shielding of each tube is provided by the metal shell which is grounded through its grounding pin as the socket terminal. The grounding connection should be short and sturdy. Many modern tubes of glass construction have internal shields, usually connected to the cathode; where present, these shields are indicated in the socket diagram.

**Dress of Circuit Leads**

At high frequencies such as are encountered in FM and television receivers, lead dress, that is, the location and arrangement of the leads used for connections in the receiver, is very important. Because even a short lead provides a large impedance at high frequencies, it is necessary to keep all high-frequency leads as short as possible. This precaution is especially important for ground connections and for all connections to bypass capacitors and high-frequency filter capacitors. The ground connections of plate and screen-grid bypass capacitors of each tube should be kept short and made directly to cathode ground.

Particular care should be taken with the lead dress of the input and output circuits of high-frequency stages so that the possibility of stray coupling is minimized. Unshielded leads connected to shielded components should be dressed close to the chassis. As the frequency increases, the need for careful lead dress becomes increasingly important.

In high-gain audio amplifiers, these same precautions should be taken to minimize the possibility of self-oscillation.

**Filters**

Feedback effects also are caused in radio or television receivers by coupling between stages through common voltage-supply circuits. Filters find an important use in minimizing such effects. They should be placed in voltage-supply leads to each tube in order to return the signal current through a low-impedance path direct to the tube cathode rather than by way of the voltage-supply circuit. Fig. 89 illustrates several forms of filter circuits. Capacitor C forms the low-impedance path, while the choke or resistor assists in diverting the signal through the capacitor by offering a high impedance to the power-supply circuit.

The choice between a resistor and a choke depends chiefly upon the permissible dc voltage drop through the filter. In circuits where the current is small (a few milliamperes), resistors are practical; where the current is large or regulation important, chokes are more suitable.

The minimum practical size of the capacitors may be estimated in most cases by the following rule: The impedance of the capacitor at the lowest fre-
frequency amplified should not be more than one-fifth of the impedance of the filter choke or resistor at that frequency. Better results will be obtained in special cases if the ratio is not more than one-tenth.

Radio-frequency circuits, particularly at high frequencies, require high-quality capacitors. Mica or ceramic capacitors are preferable. Where stage shields are employed, filters should be placed within the shield.

Another important application of filters is to smooth the output of a rectifier tube. See Rectification. A smoothing filter usually consists of capacitors and iron-core chokes. In any filter-design problem, the load impedance must be considered as an integral part of the filter because the load is an important factor in filter performance. Smoothing effect is obtained from the chokes because they are in series with the load and offer a high impedance to the ripple voltage. Smoothing effect is obtained from the capacitors because they are in parallel with the load and store energy on the voltage peaks; this energy is released on the voltage dips and serves to maintain the voltage at the load substantially constant. Smoothing filters are classified as choke-input or capacitor-input according to whether a choke or capacitor is placed next to the rectifier tube. See Fig. 90.

The CIRCUIT SECTION gives a number of examples of rectifier circuits with recommended filter constants.

If an input capacitor is used, consideration must be given to the instantaneous peak value of the ac input voltage. This peak value is about 1.4 times the rms value as measured by an ac voltmeter. Filter capacitors, therefore, especially the input capacitor, should have a rating high enough to withstand the instantaneous peak value if break-

down is to be avoided. When the input choke method is used, the available dc output voltage will be somewhat lower than with the input-capacitor method for a given ac plate voltage. However, improved regulation together with lower peak current will be obtained.

Mercury-vapor and gas-filled rectifier tubes occasionally produce a form of local interference in radio receivers through direct radiation or through the power line. This interference is generally identified in the receiver as a broadly tunable 120-cycle buzz (100 cycles for 50-cycle supply line, etc.). It is usually caused by the formation of a steep wave front when plate current within the tube begins to flow on the positive half of each cycle of the ac supply voltage.

There are several ways of eliminating this type of interference. One is to shield the tube. Another is to insert an rf choke having an inductance of one millihenry or more between each plate and transformer winding and to connect high-voltage, rf bypass capacitors between the outside ends of the transformer winding and the center tap. (See Fig. 91.) The rf chokes should be placed within the shielding of the tube. The rf bypass capacitors should have a voltage rating high enough to withstand the peak voltage of each half of the secondary, which is approximately 1.4 times the rms value.

Transformers having electrostatic shielding between primary and second-
ary are not likely to transmit rf disturbances to the line. Often the interference may be eliminated simply by making the plate leads of the rectifier extremely short. In general, the particular method of interference elimination must be selected by experiment for each installation.

Output-Coupling Devices

An output-coupling device is used in the plate circuit of a power output tube to keep the comparatively high dc plate current from the winding of an electromagnetic speaker and, also, to transfer power efficiently from the output stage to a loudspeaker of either the electromagnetic or dynamic type.

Output-coupling devices are of two types, (1) choke-capacitor and (2) transformer. The choke-capacitor type includes an iron-core choke having an inductance of not less than 10 henries which is placed in series with the plate and B-supply. The choke offers a very low resistance to the dc plate current component of the signal voltage but opposes the flow of the fluctuating component. A bypass capacitor of 2 to 6 microfarads supplies a path to the speaker winding for the signal voltage. The choke-coil output coupling device, however, is now only of historical interest.

The transformer type is constructed with two separate windings, a primary and a secondary wound on an iron core. This construction permits designing each winding to meet the requirements of its position in the circuit. Typical arrangements of each type of coupling device are shown in Fig. 92. Examples of transformers for push-pull stages are shown in several of the circuits given in the CIRCUIT SECTION.

High-Voltage Considerations for Television Picture Tubes

Like other high-voltage devices, television picture tubes require that certain precautions be observed to minimize the possibility of failure caused by humidity, dust, and corona.

Humidity Considerations. When humidity is high, a continuous film of moisture may form on the glass bulb immediately surrounding the ultraviolet cap of all-glass picture tubes or on the glass part of the envelope of metal picture tubes. This film may permit sparking to take place over the glass surface to the external conductive coating or to the metal shell. Such sparking may introduce noise into the receiver. To prevent such a possibility, the uncoated bulb surface around the cap and the glass part of the envelope of metal picture tubes should be kept clean and dry.

Dust Considerations. The accumulation of dust on the uncoated area of the bulb around the ultraviolet cap of all-glass picture tubes or on the glass part of the envelope or insulating supports for metal picture tubes will decrease the insulating qualities of these parts. The dust usually consists of fibrous materials and may contain soluble salts. The fibers absorb and retain moisture; the soluble salts provide electrical leakage paths that increase in conductivity as the humidity increases. The resulting high leakage currents may overload the high-voltage power supply.

It is recommended, therefore, that the uncoated bulb surface of all-glass picture tubes and the coated glass surface and insulating supports for metal picture tubes be kept clean and free from dust or other contamination such as finger-prints. The frosted Filterglass faceplate of the metal picture tubes may be cleaned with a soapless detergent, such as Dref, then rinsed with clean water, and immediately dried.

Corona Considerations. A high-voltage system may be subject to corona, especially when the humidity is high, unless suitable precautions are taken. Corona, which is an electrical discharge appearing on the surface of a conductor when the voltage gradient exceeds the breakdown value of air, causes deterio-
ration of organic insulating materials through formation of ozone, and induces arc-over at points and sharp edges. Sharp points or other irregularities on any part of the high-voltage system may increase the possibility of corona and should be avoided.

In the metal-shell picture tubes, the metal lip at the maximum diameter has rounded edges to prevent corona. Adequate spacing between the lip and any grounded element in the receiver, or between the small end of the metal shell and any grounded element, should be provided to preclude the possibility of corona. Such spacing should not be less than 1 inch of air. Similarly, an air space of 1 inch, or equivalent, should be provided around the body of the metal shell. As a further precaution to prevent corona, the deflecting-yoke surface on the end adjacent to the shell should present a smooth electrical surface with respect to the small end of the metal shell or the ultor terminal of all-glass tubes.

**Picture-Tube Safety Considerations**

**Tube Handling.** Breakage of picture tubes, which contain a high vacuum, may result in injury from flying glass. Do not strike or scratch the tube or subject it to more than moderate pressure when installing it in or removing it from electronic equipment.

**High-Voltage Precautions.** In picture-tube circuits, high voltages may appear at normally low-potential points in the circuit because of capacitor breakdown or incorrect circuit connections. Therefore, before any part of the circuit is touched the power-supply switch should be turned off, the power plug disconnected, and both terminals of any capacitors grounded.

**X-Ray Radiation Precautions.** All types of picture tubes may be operated at voltages (if ratings permit) up to 16 kilovolts without producing harmful x-ray radiation or danger of personal injury on prolonged exposure at close range. Above 16 kilovolts, special x-ray shielding precautions may be necessary.
Interpretation of Tube Data

The tube data given in the following TUBE TYPES SECTION include ratings, typical operation values, characteristics, and characteristic curves.

The values for grid-bias voltages, other electrode voltages, and electrode supply voltages are given with reference to a specified datum point as follows: For types having filaments heated with dc, the negative filament terminal is taken as the datum point to which other electrode voltages are referred. For types having filaments heated with ac, the mid-point (i.e., the center tap on the filament-transformer secondary, or the midpoint on a resistor shunting the filament) is taken as the datum point. For types having unipotential cathodes indirectly heated, the cathode is taken as the datum point.

Electrode voltage and current ratings are in general self-explanatory, but a brief explanation of other ratings will aid in the understanding and interpretation of tube data.

Heater warm-up time is defined as the time required for the voltage across the heater to reach 80 per cent of the rated value in the circuit shown in Fig. 93. The heater is placed in series with a resistance having a value 3 times the nominal heater operating resistance \( R = 3 \frac{E_f}{I_f} \), and a voltage having a value 4 times the rated heater voltage \( V = 4 E_f \) is then applied. The warm-up time is determined when \( E = 0.8 E_f \).

Plate dissipation is the power dissipated in the form of heat by the plate as a result of electron bombardment. It is the difference between the power supplied to the plate of the tube and the power delivered by the tube to the load.

**Grid-No.2 (Screen-grid) Input** is the power applied to the grid-No.2 electrode and consists essentially of the power dissipated in the form of heat by grid No.2 as a result of electron bombardment. With tetrodes and pentodes, the power dissipated in the screen-grid circuit is added to the power in the plate circuit to obtain the total B-supply input power.

Peak heater-cathode voltage is the highest instantaneous value of voltage that a tube can safely stand between its heater and cathode. This rating is applied to tubes having a separate cathode terminal and used in applications where excessive voltage may be introduced between heater and cathode.

Maximum peak inverse plate voltage is the highest instantaneous plate voltage which the tube can withstand recurrently in the direction opposite to that in which it is designed to pass current. For mercury-vapor tubes and gas-filled tubes, it is the safe top value to prevent arc-back in the tube operating within the specified temperature range.

Referring to Fig. 94, when plate A of a full-wave rectifier tube is positive, current flows from A to C, but not from B to C, because B is negative. At the instant plate A is positive, the filament is positive (at high voltage) with respect to plate B. The voltage between the positive filament and the negative plate B is in inverse relation to that causing current flow. The peak value of this voltage is limited by the resistance and nature of the path between plate B and filament. The maximum value of this voltage at which there is no danger of breakdown of the tube is known as maximum peak inverse voltage.

The relations between peak inverse
voltage, rms value of ac input voltage, and dc output voltage depend largely on the individual characteristics of the rectifier circuit and the power supply. The presence of line surges or any other transient, or wave-form distortion, may raise the actual peak voltage to a value higher than that calculated for sine-wave voltages. Therefore, the actual inverse voltage, and not the calculated value, should be such as not to exceed the rated maximum peak inverse voltage for the rectifier tube. A calibrated cathode-ray oscillograph or a peak-indicating electronic voltmeter is useful in determining the actual peak inverse voltage.

In single-phase, full-wave circuits with sine-wave input and with no capacitor across the output, the peak inverse voltage on a rectifier tube is approximately 1.4 times the rms value of the plate voltage applied to the tube. In single-phase, half-wave circuits with sine-wave input and with capacitor input to the filter, the peak inverse voltage may be as high as 2.8 times the rms value of the applied plate voltage. In polyphase circuits, mathematical determination of peak inverse voltage requires the use of vectors.

**Maximum dc output current** is the highest average plate current which can be handled continuously by a rectifier tube. Its value for any rectifier tube type is based on the permissible plate dissipation of that type. Under operating conditions involving a rapidly repeating duty cycle (steady load), the average plate current may be measured with a dc meter. Curves of average plate characteristics for several half-wave vacuum rectifiers are given in Figs. 95 and 96. These curves are shown solid up to the maximum average or dc plate-current rating of each type.

**Maximum peak plate current** is the highest instantaneous plate current that a tube can safely carry recurrently in the direction of normal current flow. The safe value of this peak current in hot-cathode types of rectifier tubes is a function of the electron emission available and the duration of the pulsating current flow from the rectifier tube in each half-cycle.

The value of peak plate current in a given rectifier circuit is largely deter-

The **Rating Chart** for full-wave rectifiers presents graphically the relationships between maximum ac voltage input and maximum dc output current derived from the fundamental ratings for conditions of capacitor-input and choke-input filters. This graphical presentation provides for considerable latitude in choice of operating conditions.

The **Operation Characteristics** for a full-wave rectifier with capacitor-input filter show by means of boundary line “ADK” the limiting current and voltage relationships presented in the Rating Chart.

The **Operation Characteristics** for a full-wave rectifier with choke-input filter not only show by means of boundary line “CEK” the limiting current and voltage relationships presented in the Rating Chart, but also give information as to the effect on regulation of various sizes of chokes. The solid-line curves show the dc voltage outputs which would be obtained if the filter chokes had infinite inductance. The long-dash lines radiating from the zero position are boundary lines for various sizes of chokes as indicated. The intersection of one of these lines with a solid-line curve indicates the point on the curve at which the choke no longer behaves as though it had infinite inductance. To the left of the choke boundary line, the regulation curves depart from the solid-line curves as shown by the representative short-dash regulation curves.

**Typical Operation Values.** Values for typical operation are given for many types in the TUBE TYPES SECTION. These typical operating values are given to show concisely some guiding information for the use of each type. These values should not be confused with ratings, because a tube can be used under any suitable conditions within its maximum ratings, according to the application.
The power output value for any operating condition is an approximate tube output—that is, plate input minus plate loss. Circuit losses must be subtracted from tube output in order to determine the useful output.

Characteristics are covered in the ELECTRON TUBE CHARACTERISTICS SECTION and such data should be interpreted in accordance with the definitions given in that section. Characteristic curves represent the characteristics of an average tube. Individual tubes, like any manufactured product, may have characteristics that range above or below the values given in the characteristic curves.

Although some curves are extended well beyond the maximum ratings of the tube, this extension has been made only for convenience in calculations. Do NOT operate a tube outside of its maximum ratings.

Inter electrode capacitances are direct capacitances measured between specified elements or groups of elements in electron tubes. Unless otherwise indicated in the data, all capacitances are measured with filament or heater cold, with no direct voltages present, and with no external shields. All electrodes other than those between which capacitance
is being measured are grounded. In twin or multi-unit types, inactive units are also grounded.

The capacitance between the input electrode and all other electrodes, except the output electrode, connected together is commonly known as the input capacitance. The capacitance between the output electrode and all other electrodes, except the input electrode, connected together is known as the output capacitance.

Ratings for most receiving-type tubes are given according to the "design-center" system, which was adopted by the industry in 1939. Design-center ratings include allowances for normal variations in both tube characteristics and operating conditions, and should be interpreted as follows:

1. CATHODE—The heater or filament voltage is given as a normal value unless otherwise stated. This means that transformers or resistances in the heater or filament circuit should be designed to operate the heater or filament at rated value for full-load operating conditions under average supply-voltage conditions. A reasonable amount of leeway is incorporated in the cathode design so that moderate fluctuations of heater or filament voltage downward will not cause marked falling off in response; also moderate voltage fluctuations upward will not reduce the life of the cathode to an unsatisfactory degree.

A. 1.4-Volt Battery Tube Types—
The filament power supply may be obtained from dry-cell batteries, from storage batteries, or from a power line. With dry-cell battery supply, the filament may be connected either directly across a battery rated at a terminal potential of 1.5 volts, or in series with the filaments of similar tubes across a power supply consisting of dry cells in series. In either case, the voltage across each 1.4-volt section of filament should not exceed 1.6 volts.

With power-line or storage-battery supply, the filament may be operated in series with the filaments of similar tubes. For such operation, design adjustments should be made so that, with tubes of rated characteristics, operating with all electrode voltages applied and on a normal line voltage of 117 volts or on a normal storage-battery voltage of 2.0 volts per cell (without a charger) or 2.2 volts per cell (with a charger), the voltage drop across each 1.4-volt section of filament will be maintained within a range of 1.25 to 1.4 volts with a nominal center of 1.3 volts. In order to meet the recommended conditions for operating filaments in series from dry-battery, storage-battery, or power-line sources it may be necessary to use shunting resistors across the individual 1.4-volt sections of filament.

B. 2.0-Volt Battery Tube Types—
The 2.0-volt line of tubes is designed to be operated with 2.0 volts across the filament. In all cases the operating voltage range should be maintained within the limits of 1.8 volts to 2.2 volts.

2. POSITIVE POTENTIAL ELECTRODES—The power sources for the operation of radio equipment are subject to variations in their terminal potential. Consequently, the maximum ratings shown on the tube-type data sheets have been established for certain Design Center Voltages which experience has shown to be representative. The Design Center Voltages to be used for the various power supplies together with other rating considerations are as given below:

A. AC or DC Power Line Service in U.S.A. The design center voltage for this type of power supply is 117 volts. The maximum ratings of plate voltages, screen-grid supply voltages, dissipations, and rectifier output currents are design maximums and should not be exceeded in equipment operated at a line voltage of 117 volts.

B. Storage-Battery Service—When storage-battery equipment is operated without a charger, it should be designed so that the published maximum values of plate voltages, screen-grid supply voltages, dissipations, and rectifier output currents are never exceeded for a terminal potential at the battery source of 2.0 volts per cell. When storage-battery equipment is operated with a charger, it should be designed so that 90 per cent of the same maximum values is never exceeded for a terminal potential at the battery source of 2.2 volts.

C. "B"-Battery Service—The design center voltage for "B" batteries is
the normal voltage rating of the battery block, such as 45 volts, 90 volts, etc. Equipment should be designed so that under no condition of battery voltage will the plate voltages, screen-grid supply voltages, or dissipations ever exceed the recommended respective maximum values shown in the data for each tube type by more than 10 per cent.

D. Other Considerations —

a. Class A1 Amplifiers — The maximum plate dissipation occurs at the “Zero-Signal” condition. The maximum screen-grid dissipation usually occurs at the condition where the peak-input signal voltage is equal to the bias voltage.

b. Class B Amplifiers — The maximum plate dissipation theoretically occurs at approximately 63 per cent of the “Maximum-Signal” condition, but practically may occur at any signal voltage value.

c. Converters — The maximum plate dissipation occurs at the “Zero-Signal” condition and the frequency at which the oscillator-developed bias is a minimum. The screen-grid dissipation for any reasonable variation in signal voltage must never exceed the rated value by more than 10 per cent.

d. Screen-Grid Ratings — When the screen-grid voltage is supplied through a series voltage-dropping resistor, the maximum screen-grid voltage rating may be exceeded, provided the maximum screen-grid dissipation rating is not exceeded at any signal condition, and the maximum screen-grid voltage rating is not exceeded at the maximum-signal condition. Provided these conditions are fulfilled, the screen-grid supply voltage may be as high as, but not above, the maximum plate voltage rating.

For certain voltage amplifier types, as listed in the data section, the maximum permissible screen-grid (grid-No.2) input varies with the screen-grid voltage, as shown in Fig. 97. Full rated screen-grid input is permissible at screen-grid voltages up to 50 per cent of the maximum rated screen-grid supply voltage. From the 50-per-cent point to the full rated value of supply voltage, the screen-grid input must be decreased. The decrease in allowable screen-grid input follows a curve of the parabolic form. This rating chart is useful for applications utilizing either a fixed screen-grid voltage or a series screen-grid voltage.
dropping resistor. When a fixed voltage is used, it is necessary only to determine that the screen-grid input is within the boundary of the operating area on the chart at the selected value of screen-grid voltage to be used. When a voltage-dropping resistor is used, the minimum value of resistor that will assure tube operation within the boundary of the curve can be determined from the following relation:

\[ R_{g2} \geq \frac{E_{c2}(E_{c2} - E_{cs})}{P_{c2}} \]

where \( R_{g2} \) is the minimum value for the voltage-dropping resistor in ohms, \( E_{c2} \) is the selected screen-grid voltage in volts, \( E_{c2} \) is the screen-grid supply voltage in volts, and \( P_{c2} \) is the screen-grid input in watts corresponding to \( E_{c2} \).

Ratings for some recent receiving tubes are given according to the new "design-maximum" system, which was adopted by the industry in 1957. Design-maximum ratings allow for normal tube-characteristic variations, but do not provide for variations in operating conditions. When these ratings are given, the equipment designer has the responsibility for determining the worst probable operating conditions which will be encountered and for insuring that no design-maximum value will be exceeded with a tube having characteristics equal to the published value.

Unless otherwise stated, ratings given in this Manual are based on the "design-center" system.
Typical Tube-Part Materials
in RCA Electron Tube

1. **ENVELOPE**—Lime glass
2. **SPACER**—Mica sprayed with magnesium oxide
3. **PLATE**—Carbonized nickel or nickel-plated steel
4. **GRID WIRES**—Manganese-nickel or molybdenum
5. **GRID SIDE-RODS**—Chrome copper, nickel, or nickel-plated iron
6. **CATHODE**—Nickel coated with barium-calcium-strontium carbonates
7. **HEATER**—Tungsten or tungsten-molybdenum alloy with insulating coating of alundum
8. **CATHODE TAB**—Nickel
9. **MOUNT SUPPORT**—Nickel or nickel-plated iron
10. **GETTER SUPPORT AND LOOP**—Nickel or nickel-plated iron
11. **GETTER**—Barium-magnesium alloys
12. **HEATER CONNECTOR**—Nickel or nickel-plated iron
13. **STEM LEAD-IN WIRES**—Nickel, dume, copper
14. **PRESSED STEM**—Lead glass
15. **BASE**—Bakelite
16. **BASE PINS**—Nickel-plated brass
RCA Receiving Tube
Classification Chart

RCA receiving tubes are classified in the following chart according to function and filament or heater voltage. Types having similar electrical characteristics are grouped in brackets. For more complete data on these types, refer to the TUBE TYPES SECTION. When choosing a tube type, refer to information on Preferred Types and the listing of Types Not Recommended for New Equipment Design on the inside back cover. For information on picture tubes, refer to the RCA PICTURE TUBE CHARACTERISTICS CHART on pages 326 through 333. For explanation of symbols on charts, see footnotes.

Structure of a Miniature Tube
RCA Tube Types

Technical Data

This section contains technical descriptions of RCA tubes used in standard broadcast, FM, and television receivers. It includes data on current types, as well as information on those RCA discontinued types in which there may still be some interest as to characteristics. Information on picture tubes is contained in a chart at the end of this section.

In choosing tube types for the design of new electronic equipment, the designer is referred to the inside back cover for information regarding the availability of the latest RCA Preferred Types List and for a listing of RCA Tube Types Not Recommended for New Equipment Design.

Tube types are listed in this section according to the numerical-alphabetical-numerical sequence of their type designations. For Key to Socket Connection Diagrams, see inside front cover.

FULL-WAVE GAS RECTIFIER

Metal type OZ4 and glass octal type OZ4-G are used in vibrator-type B-supply units. Both have ionically heated cathodes, require octal sockets, and may be mounted in any position. OZ4 Outline 2, OUTLINES SECTION. OZ4-G dimensions: maximum over-all length, 2-5/8 inches; maximum diameter, 1-1/16 inches; T-7 bulb; dwarf-shell octal 5-pin base. Base of OZ4-G has no pin No. 2. Shell of OZ4 and external shield of OZ4-G should be grounded. Filters may be necessary to eliminate objectionable noise. Maximum ratings for full-wave rectifier service: peak starting supply volts (per plate), 300 min; peak plate-to-plate volts, 1000 max; peak plate ma. (per plate), 200 max; dc output ma., 75 max, 30 min; dc output volts, 300 max; average dynamic tube voltage drop, 24 volts. These types are used principally for renewal purposes.

DIODE

Miniature type used as detector tube in portable FM receivers and in portable high-frequency measuring equipment. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket. Heater volts (ac/dc) 1.4; amperes, 0.15.

Maximum Ratings:

Typical Operation (With Capacitor-Input Filter):

| AC Plate-Supply Voltage (rms) | 117 volts |
| Filter-Input Capacitor | 2 μf |
| Minimum Total Effective Plate-Supply Impedance | 0 ohms |
REMOTE-CUTOFF PENTODE

Glass type used in battery-operated receivers as rf or if amplifier. This type is similar electrically to type 1D5-G. Outline 40, OUTLINES SECTION. Tube requires four-contact socket. Filament volts (dc), 2.0; amperes, 0.06. Type 1A4-P is a DISCONTINUED type listed for reference only.

POWER PENTODE

Glass octal type used in output stage of battery-operated receivers. Outline 22, OUTLINES SECTION. This type may be supplied with pin No. 1 omitted. Tube requires octal socket and may be mounted in any position. For filament considerations, refer to type 1U4. Filament volts (dc), 1.4; amperes, 0.05. Typical operation as class A; amplifier; plate and grid-No.2 volts, 90 (110 max); grid-No.1 volts, -4.5; peak a grid-No.1 volts, 4.5; plate ma., 4.0; grid-No.2 ma., 1.1; plate resistance (approx.), 0.3 megohm; transconductance, 850 μmhos; load resistance, 2500 ohms; power output, 115 milliwatts. Type 1A5-GT is used principally for renewal purposes.

PENTAGRID CONVERTER

Glass type used in battery-operated receivers. This type is identical electrically with type 1D7-G, except for interelectrode capacitances. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Filament volts (dc), 2.0; amperes, 0.06. Type 1A6 is a DISCONTINUED type listed for reference only.

PENTAGRID CONVERTER

Glass octal type used in superheterodyne circuits having battery power supplies. Outline 23, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Filament volts (dc), 1.4; amperes, 0.05.

CONVERTER SERVICE

Maximum Ratings:

| Plate Voltage                      | 110 max volts |
| Grid-No.3-and-No.5 (screen-grid) Voltage | 60 max volts |
| Grid-No.3-and-No.5 Supply Voltage | 110 max volts |
| Grid-No.2 (anode-grid) Voltage     | 130 max volts |
| Total Zero-Signal Cathode Current  | 4 max ma      |

Typical Operation:

| Plate Voltage | 90 volts |
| Grid-No.3-and-No.5 Voltage* | 45 volts |
| Grid-No.2 Voltage | 90 volts |
| Grid-No.4 (control-grid) Voltage** | 0 volts |
| Grid-No.1 (oscillator-grid) Resistor | 0.2 megohm |
| Plate Resistance | 0.6 megohm |
| Conversion Transconductance | 250 μmhos |
| Conversion Transconductance with grid-No.4 bias of -3 volts (Approx.) | 20 μmhos |
| Plate Current | 0.6 ma |
| Grid-No.3-and-No.5 Current | 0.7 ma |
| Grid-No.2 Current | 1.2 ma |
| Grid-No.1 Current | 0.035 ma |
| Total Cathode Current | 2.5 ma |

* Obtained preferably by using a bypassed 45000- to 75000-ohm voltage-dropping resistor in series with the 90-volt supply.
** A resistance of at least 1.0 megohm should be in the grid return to negative filament pin.
POWER PENTODE

Subminiature type used in output stage of small, compact, battery-operated receivers for the standard AM broadcast band. Outline 8, OUTLINE SECTION. Tube requires subminiature eight-contact socket. Filament volts (dc), 1.25; amperes, 0.04. Filament voltage should never exceed 1.6 volts. Typical operation as Class A1 amplifier: plate and grid-No.2 volts, 67.5 max; grid-No.1 volts, -4.5; peak af grid-No.1 volts, 4.6; zero-signal plate ma., 2; zero-signal grid-No.2 ma., 0.4; cathode ma., 4 max; plate resistance, 0.15 megohm; transconductance, 750 μmhos; load resistance, 25000 ohms; total harmonic distortion, 10 per cent; maximum-signal power output, 50 milliwatts. This is a DISCONTINUED type listed for reference only.

SHARP-CUTOFF PENTODE

Subminiature type used as rf or if amplifier in stages not controlled by aeq in small, compact, battery-operated receivers for the standard AM broadcast band. Outline 8, OUTLINE SECTION. Tube requires subminiature eight-contact socket. Filament volts (dc), 1.26; amperes, 0.04. Filament voltage should never exceed 1.6 volts. Characteristics as class A1 amplifier: plate and grid-No.2 volts, 67.5 max; grid-No.1 volts, 0; plate resistance, 0.7 megohm; transconductance, 735 μmhos; total cathode ma., 4 max; plate ma., 1.85; grid-No.2 ma., 0.75. This is a DISCONTINUED type listed for reference only.

HALF-WAVE VACUUM RECTIFIER

Miniature type used as rectifier of high-voltage pulses produced in the scanning systems of television receivers. Outline 17, OUTLINE SECTION. Tube requires miniature nine-contact socket. Pin No.3 may be connected to the filament, or used as a tie point for the filament-dropping resistor; otherwise it should not be used. Filament volts (ae), 1.4; amperes, 0.65. For filament and high-voltage considerations, refer to type 1B3-GT. Type 1AX2 is used principally for renewal purposes.

PULSED-RECTIFIER SERVICE

For operation in a 585-line, 30-frame system

| Maximum Ratings: | | |
|------------------|------------------|
| Peak Inverse Plate Voltage (Absolute Maximum) | 25000 volts |
| Peak Plate Current | 11 max ma |
| Average Plate Current | 1 max ma |

Typical Operation:

Peak Plate-Supply Voltage:
- Positive pulse value
- Negative pulse value
- DC Output Voltage (Approx.)
- DC Output Current (Approx.)

Under no circumstances should this absolute value be exceeded.

HALF-WAVE VACUUM RECTIFIER

Glass octal type used in high-voltage, low-current applications such as the rectifier in a high-voltage, rf-operated power supply or as a rectifier of high-voltage pulses produced in television scanning systems. When used as an rf rectifier, one 1B3-GT in a half-wave circuit is capable of delivering a maximum dc output voltage of about 15000 volts. In a voltage-doubler circuit, two tubes will give about 30000 volts; and in a voltageretriever circuit, three 1B3-GT's will deliver 45000 volts approximately. For curve of average plate characteristics, see page 67.
RCA Receiving Tube Manual

FILAMENT VOLTAGE (AC) ........................................ 1.25* volts
FILAMENT CURRENT ........................................ 0.2 amperes
DIRECT INTERELECTRODE CAPACITANCE (Approx.):
Plate to Filament and Internal Shield .................. 1.3 µf
* Under no circumstances should the filament voltage be less than 1.05 volts or greater than 1.45 volts.

PULSED-RECTIFIER SERVICE

Maximum Ratings: For operation in a 525-line, 3a-frame system
PEAK INVERSE PLATE VOLTAGE (Absolute Maximum) ............ 26000* volts
PEAK PLATE CURRENT ........................................ 50 ma
AVERAGE PLATE CURRENT .................................. 0.5 ma

Maximum Ratings: RADIO-FREQUENCY RECTIFIER SERVICE
PEAK INVERSE PLATE VOLTAGE (Absolute Maximum) ............ 33000* volts
PEAK PLATE CURRENT ........................................ 30 ma
AVERAGE PLATE CURRENT .................................. 1 ma
FREQUENCY RANGE OF SUPPLY VOLTAGE ..................... 1.5 to 100 Kc
* The dc component must not exceed 21000 volts.
* Under no circumstances should this absolute value be exceeded.

INSTALLATION AND APPLICATION

Type 1B3-GT requires an octal socket and may be mounted in any position. Plate connection is cap at top of bulb. Internal connections are made to pins 1, 3, 5, and 8. These pins may be connected to pin 7; otherwise they should not be used. This type may be supplied with pin No.1 and/or pin No.6 omitted. Outline 32, OUTLINES SECTION.

The high voltages at which the 1B3-GT is operated are very dangerous. Great care should be taken to prevent coming in contact with these high voltages. In those circuits where the filament circuit is not grounded, the filament circuit operates at dc potentials which can cause fatal shock. Extreme precautions must be taken when the filament voltage is measured. These precautions must include safeguards which definitely eliminate all hazards to personnel. The filament transformer, whether it is of the iron-core or the air-core type, must be sufficiently insulated.

The voltages employed in some television receivers and other high-voltage equipment may be sufficiently high to cause high-voltage rectifier tubes such as the 1B3-GT to produce soft X-rays which can constitute a health hazard unless the tubes are adequately shielded. Relatively simple shielding should prove adequate, but the need for this precaution should be considered.

SHARP-CUTOFF PENTODE

1B4-P

Glass type used as rf amplifier or detector in battery-operated receivers. Outline 40, OUTLINES SECTION. Tube requires four-contact socket. For typical operating conditions and maximum ratings as a class A1 amplifier, refer to type 1E5-GP. Filament volts (dc), 2.0 amperes, 0.06. Type 1B4-P is a DISCONTINUED type listed for reference only.

TWIN DIODE—MEDIUM-MU TRIODE

1B5/25S

Glass type used as combined detector, amplifier, and avc tube in battery-operated receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires six-contact socket. Filament volts (dc), 2.0 amperes, 0.06. Typical operation as class A1 amplifier: plate volts, 135 max; grid volts, -3; plate ma, 0.8; plate resistance, 55000 ohms; amplification factor, 20; transconductance, 575 µmhos. This is a DISCONTINUED type listed for reference only.

PENTAGRID CONVERTER

1B7-GT

Glass octal type used in superheterodyne circuits having battery power supply. Outline 23, OUTLINES SECTION. Filament volts (dc), 1.4; amperes, 0.1. This is a DISCONTINUED type listed for reference only. The 1B7-GT may be replaced by the 1A7-GT if circuit adjustment is made for lower filament current of type 1A7-GT.

80
POWER PENTODE

Glass octal type used in output stage of battery-operated receivers. Outline 22, OUTLINES SECTION. This type may be supplied with pin No.1 omitted. Tube requires octal socket. Filament volts (dc), 1.4; amperes, 0.1. Typical operation as class A; amplifier: plate and grid-No.2 volts, 90 (110 max); grid-No.1 volts, -7.5; peak af grid-No.1 volts, 7.5; plate ma., 7.8; grid-No.2 ma., 3.5; plate resistance (approx.), 115000 ohms; transconductance, 1550 μhos; load resistance, 8000 ohms; power output, 240 milliwatts. Type 1C5-GT is used principally for renewal purposes.

PENTAGRID CONVERTER

Glass type used in battery-operated receivers. Similar electrically to type 1C7-G except for interelectrode capacitances. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Filament volts (dc), 2.0; amperes, 0.12. Type 1C6 is a DISCONTINUED type listed for reference only.

PENTAGRID CONVERTER

Glass octal type used in battery-operated receivers. Outline 39, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.12. Typical operation as converter: plate volts, 180 max; grids-No.3-and-No.5 (screen-grid) volts, 67.5 max; grid-No.2 (anode-grid) supply volts, 180 (applied through 20000-ohm dropping resistor bypassed by 0,01-μf capacitor); grid-No.4 (control-grid) volts, -3; grid-No.1 (oscillator-grid) resistor, 50000 ohms; plate ma., 1.5; grids-No.3-and-No.5 ma., 2; grid-No.2 ma., 4; grid-No.1 ma., 0.2. This is a DISCONTINUED type listed for reference only.

REMOTE-CUTOFF PENTODE

Glass octal type used in battery-operated receivers as rf or if amplifier. Outline 35, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.06. Typical operation as class A; amplifier: plate volts, 180 max; grid-No.2 (screen-grid) volts, 67.5 max; grid-No.1 volts, -3 min; plate ma., 2.3; grid-No.2 ma., 0.8; plate resistance (approx.), 1.0 megohm; transconductance, 750 μhos; load resistance at bias of -15 volts, 15 μhos. This is a DISCONTINUED type listed for reference only.

REMOTE-CUTOFF TETRODE

Glass octal type used in battery-operated receivers as rf or if amplifier. Outline 39, OUTLINES SECTION. Filament volts (dc), 2.0; amperes, 0.06. This is a DISCONTINUED type listed for reference only. It is similar electrically to type 1D5-GP.

PENTAGRID CONVERTER

Glass octal type used in battery-operated receivers. Outline 39, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.06. Typical operation as converter: plate volts, grids-No.3-and-No.5 volts, grid-No.2 supply volts, grid-No.4 volts, and grid-No.1 resistor are same as for type 1C7-G; plate ma., 1.3; grids-No.3-and-No.5 ma., 2.4; grid-No.2 ma., 2.3; grid-No.1 ma., 0.2. This is a DISCONTINUED type listed for reference only.
RCA Receiving Tube Manual

DIODE—TRIODE—POWER PENTODE

Glass octal type used in compact battery-operated receivers. Diode unit is used as detector or a-c tube, triode as first audio amplifier, and pentode as power output tube. Outline 21, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 1.4; amperes, 0.1. Typical operation of pentode unit as class A1 amplifier: plate and grid-No.2 volts, 90 (110 max); grid-No.1 volts, -9; plate ma., 5; grid-No.2 ma., 1; transconductance, 925 μmhos; load resistance, 12000 ohms; total harmonic distortion, 10 per cent; power output, 200 milliwatts. Characteristics of triode unit as class A1 amplifier: plate volts, 90 (110 max); grid volts, 0; amplification factor, 25; plate resistance (approx.), 43500 ohms; transconductance, 575 μmhos; plate ma., 1.1. This is a DISCONTINUED type listed for reference only.

DIODE—SHARP-CUTOFF PENTODE

Miniature type used in battery-operated portable radio receivers as combined AM detector and AF voltage amplifier. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

FILAMENT VOLTAGE (DC) .................................................. 1.4 volts
FILAMENT CURRENT ....................................................... 0.05 ampere

### Characteristics:

Average Plate Current with dc plate voltage of 10 volts: 1 ma

---

### SHARP-CUTOFF PENTODE

Glass octal type used as rf amplifier or detector in battery-operated receivers. Outline 39, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.06. Characteristics as class A; amplifier: plate volts, 180 max; grid-No.2 volts, 67.5 max; grid-No.1 volts, -3; plate ma, 1.7; grid-No.2 ma, 0.6; plate resistance, 1.5 megohms; transconductance, 650 µmhos. This is a DISCONTINUED type listed for reference only.

---

### TWIN POWER PENTODE

Glass octal type used in push-pull output stage of battery-operated receivers. Outline 22, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.24. Typical operation as push-pull class A amplifier: plate and grid-No.2 volts, 135 max; grid-No.1 volts, -7.5; plate ma, 10.6; grid-No.2 ma, 3.5; output watts, 0.575. This is a DISCONTINUED type listed for reference only.

---

### PENTAGRID CONVERTER

Subminiature type used in small, compact, battery-operated receivers for the standard AM broadcast band. Outline 8, OUTLINES SECTION. Tube requires subminiature eight-contact socket. Filament volts (dc), 1.25; amperes, 0.04. Filament voltage should never exceed 1.6 volts. This type is used principally for renewal purposes. Typical operation as converter: plate volts and grids-No.2 and No.4 supply volts, 67.5 max; grids-No.2 and No.4 resistors, 20000 ohms; grid-No.3 volts, 0; grid-No.1 resistor, 0.1 megohm; plate resistance (approx.), 0.4 megohm; conversion transconductance, 150 µmhos; total cathode ma, 2.5 (4 max); plate ma, 1; grids-No.2 and No.4 ma, 1.5; grid-No.1 µa, 70.

---

### POWER PENTODE

Glass type used in output stage of battery-operated receivers. Outline 43, OUTLINES SECTION. Tube requires five-contact socket. Filament volts (dc), 2.0; amperes, 0.12. Type 1F4 is similar electrically to type 1F5-G. Type 1F4 is a DISCONTINUED type listed for reference only.

---

### POWER PENTODE

Glass octal type used in output stage of battery-operated receivers. Outline 42, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.12. Typical operation as class A amplifier: plate and grid-No.2 (screen-grid) volts, 135 (180 max); grid-No.1 volts, -4.5; plate ma, 8; grid-No.2 ma, 2.4; cathode resistor, 432 ohms; output watts, 0.31. This is a DISCONTINUED type listed for reference only.
TWIN DIODE—SHARP-CUTOFF PENTODE

1F6

Glass type used as combined detector, amplifier, and ave tube in battery-operated receivers. Outline 39, OUTLINES SECTION. Tube requires six-contact socket. Filament volts (dc), 2.0; amperes, 0.06. Typical operation of pentode unit as class A1 amplifier: plate volts, 180 max; grid-No.2 (screen-grid) volts, 67.5 max; grid-No.1 volts, -1.5; plate ma., 2.2; grid-No.2 ma., 0.7. This is a DISCONTINUED type listed for reference only.

TWIN DIODE—SHARP-CUTOFF PENTODE

1F7-G

Glass octal type used as combined detector, amplifier, and ave tube in battery-operated receivers. Outline 39, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.06. Similar electrically to type 1F6 except for interelectrode capacitance. Type 1F7-G is a DISCONTINUED type listed for reference only.

HALF-WAVE VACUUM RECTIFIER

1G3-GT/1B3-GT

Glass octal type used in high-voltage, low-current applications such as the rectifier in a high-voltage, rf-operated power supply or as a rectifier of high-voltage pulses produced in television scanning systems. Outline 28, OUTLINES SECTION. This type may be supplied with pins 1, 4, and 6 omitted. Tube requires octal socket and may be mounted in any position. Except for physical dimensions, this type is identical with glass octal type 1B3-GT.

MEDIUM-MU TRIODE

1G4-GT

Glass octal type used in battery-operated receivers as detector or voltage amplifier. Outline 22, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 1.4; amperes, 0.05. Typical operation and characteristics as class A1 amplifier: plate volts, 90 (110 max); grid volts, -6; plate ma., 2.3; plate resistance, 10700 ohms; amplification factor, 8.8; transconductance, 825 μhos. This is a DISCONTINUED type listed for reference only.

POWER PENTODE

1G5-G

Glass octal type used in output stage of battery-operated receivers. Outline 42, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.12. Typical operation as class A1 amplifier: plate volts, 135 max; plate ma., 9.7; output watts, 0.55. This is a DISCONTINUED type listed for reference only.

HIGH-MU TWIN POWER TRIODE

1G6-GT

Glass octal type used in output stage of battery-operated receivers. Outline 22, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 1.4; amperes, 0.1. Typical operation as class B amplifier: plate volts, 90 (110 max); dc grid volts, 0; peak af grid-to-grid volts, 48; effective grid-circuit impedance per unit, 2530 ohms; plate ma. (zero signal), 2, (maximum signal), 11; peak grid ma. per unit, 6; output watts (approx.), 0.35. This is a DISCONTINUED type listed for reference only.
MEDIUM-MU TRIODE
Glass octal type used as detector or voltage amplifier in battery-operated receivers. Outline 38, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.06. Typical operation as class A amplifier: plate volts, 180 max; grid volts, -18; amplification factor, 9.8; plate resistance, 10000 ohms; transconductance, 900 μmhos; plate ma., .1. This is a DISCONTINUED type listed for reference only.

DIODE—HIGH-MU TRIODE
Glass octal type used as combined detector and amplifier in battery-operated receivers. Outline 23, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 1.4; amperes, 0.05. Characteristics of triode unit as class A amplifier: plate volts, 90 (110 max); grid volts, 0; plate ma., 0.15; plate resistance, 240000 ohms; amplification factor, 65; transconductance, 275 μmhos. Diode is located at negative end of filament.

TWIN DIODE—MEDIUM-MU TRIODE
Glass octal type used as combined detector, amplifier, and ave tube in battery-operated receivers. Outline 38, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.06. Type 1H6-G is similar electrically to type 1B5/25S. Type 1H6-G is a DISCONTINUED type listed for reference only.

POWER PENTODE
Glass octal type used in output stage of battery-operated receivers. Outline 42, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.12. Typical operation as class A amplifier: plate and grid No.2(screen-grid)volts, 135 max; grid-No.1 volts, -16.5; plate ma., 7.0; grid-No.2 ma., 2.0; plate resistance, 105000 ohms; load resistance, 13500 ohms; output watts, 0.45. This is a DISCONTINUED type listed for reference only.

HIGH-MU TWIN POWER TRIODE
Glass octal types used in output stage of battery-operated receivers. Type 1J6-G, Outline 36; type 1J6-GT, Outline 26, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 2.0; amperes, 0.24. Typical operation as class B power amplifier: plate volts, 135 max; peak plate ma. per plate, 50 max; grid volts, 0; zero-signal plate ma. per plate, 5; effective plate-to-plate load resistance, 10000 ohms; average input watts, 0.17; output watts, 2.1. These are DISCONTINUED types listed for reference only.

PENTAGRID CONVERTER
Miniature type used in low-drain battery-operated receivers. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Filament volts (dc), 1.4; amperes, 0.95. Typical operation as converter: plate and grid No.2 volts, 90 (110 max); grids-No.3 and-No.5 supply volts, 110 max; grids-No.3 and-No.5 volts, 45 (65 max); grid-No.4 volts, 0; grid-No.1 resistor, 0.2 megohm; plate resistance (approx.), 0.65 megohm; plate ma., 0.5; grids-No.3 and-No.5 ma., 0.6; grid-No.2 ma., 1.2; grid-No.1 ma., 0.055; total cathode ma., 2.35 (4 max); conversion transconductance, 300 μmhos. This type is used principally for renewal purposes.
**POWER PENTODE**

Glass lock-in type used in output stage of battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. For electrical characteristics and typical operation, refer to glass-octal type 1A5-GT. Type 1LA4 is a DISCONTINUED type listed for reference only.

---

**PENTAGRID CONVERTER**

Glass lock-in type used in battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. Typical operation as converter is the same as for type 1A7-GT except that grid-No. 2 volts is 65 max; total cathode ma. is 4.0 max; plate resistance is 0.75 megohm, and conversion transconductance for a grid-No. 4 bias of -3 volts is 10 \( \mu \)hos. This type is used principally for renewal purposes.

---

**POWER PENTODE**

Glass lock-in type used in output stage of battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. For electrical characteristics, refer to pentode unit of glass-octal type 1D8-GT. Type 1LB4 is used principally for renewal purposes.

---

**SHARP-CUTOFF PENTODE**

Glass lock-in type used as rf or if amplifier in battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. Typical operation as class A1 amplifier: plate volts, 90 (110 max); grid-No.2 (screen-grid) volts, 45 max; grid-No.1 volts, 0; plate resistance (approx.), greater than 1 megohm; transconductance, 775 \( \mu \)hos; plate ma., 1.15; grid-No.2 ma., 0.3. This type is used principally for renewal purposes.

---

**PENTAGRID CONVERTER**

Glass lock-in type used in battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. Typical operation as converter: plate volts, 90 (110 max); grids-No.3 and-No.5 volts, 35 (45 max); grid-No.2 volts, 45; grid-No.1 volts, 0; plate resistance, 0.65 megohm; plate ma., 0.75; grids-No.3 and-No.5 ma., 0.70; grid-No.2 ma., 1.4; total cathode ma., 2.9; conversion transconductance (zero bias), 275 \( \mu \)hos. This type is used principally for renewal purposes.

---

**DIODE—SHARP-CUTOFF PENTODE**

Glass lock-in type used as combined detector and a.f. voltage amplifier in battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. Characteristics of pentode unit: plate volts, 90 (110 max); grid-No.2 volts, 45; grid-No.1 volts, 0; plate ma., 0.6; grid-No.2 ma., 0.1; plate resistance, 0.75 megohm; transconductance, 575 \( \mu \)hos. This type is used principally for renewal purposes.
MEDIUM-MU TRIODE
Glass lock-in type used as detector or voltage amplifier in battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.06. Typical operation as class A1 amplifier: plate volts, 90 (110 max); grid volts, -8; plate ma., 1.4; plate resistance, 1900 ohms; transconductance, 760 µmhos; amplification factor, 14.5. This type is used principally for renewal purposes.

REMOTE-CUTOFF PENTODE
Lock-in type used as rf or if amplifier in battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. Typical operation as class A1 amplifier: plate volts, 90 (110 max); grid-No.2 volts, 45 (110 max); grid-No.1 volts, 0; plate resistance (approx.), greater than 1 megohm; transconductance, 800 µmhos; plate ma., 1.7; grid-No.2 ma., 0.4. This type is used principally for renewal purposes.

DIODE—HIGH-MU TRIODE
Glass lock-in type used as combined detector and amplifier in battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. For electrical characteristics, refer to glass-socket type 1H5-GT. Type 1LH4 is used principally for renewal purposes.

SHARP-CUTOFF PENTODE
Glass lock-in type used as rf or if amplifier in battery-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4; amperes, 0.05. Typical operation as class A1 amplifier: plate and grid-No.2 (screen-grid) volts, 90 (110 max); grid-No.1 volts, 0; plate ma., 1.6; grid-No.2 ma., 0.35; plate resistance (approx.), 1.1 megohms; transconductance, 800 µmhos. This type is used principally for renewal purposes.

SHARP-CUTOFF PENTODE
Glass octal type used as rf or if amplifier in battery-operated receivers. Outline 28, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. When used in acv circuits, the 1N5-GT should be only partially controlled to avoid excessive reduction in receiver sensitivity with large signal input. Filament volts (dc), 1.4; amperes, 0.05. Characteristics as class A1 amplifier: plate and grid-No.2 volts, 90 (110 max); grid-No.1 volts, 0; plate resistance (approx.), 1.5 megohms; transconductance, 750 µmhos; plate ma., 1.2; grid-No.2 ma., 0.3.

DIODE—POWER PENTODE
Glass octal type used as combined detector and power output tube in battery-operated receivers. Maximum over-all length, 4 inches; maximum diameter, 1-3/16 inches. Filament volts (dc), 1.4; amperes, 0.05. Typical operation of pentode unit as class A1 amplifier: plate and grid-No.2 (screen-grid) volts, 90 (110 max); grid-No.1 volts, -4.5; plate ma., 3.1; grid-No.2 ma. (zero-signal), 0.6; plate resistance (approx.), 0.3 megohm; transconductance, 800 µmhos; load resistance, 25000 ohms; output watts, 0.1. This is a DISCONTINUED type listed for reference only.
REMOTE-CUTOFF PENTODE

Glass octal type used as rf or if amplifier in battery-operated receivers. Outline 23, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 1.4; amperes, 0.05. Typical operation as class A: amplifier: plate volts, 90 (110 max); grid-No.2 (screen-grid) volts, 90 (110 max); grid-No.1 volts, 0; plate resistance (approx.), 0.5 megohm; transconductance, 750 &mu;mhos; plate ma., 2.5; grid-No.2 ma., 0.7. This is a DISCONTINUED type listed for reference only.

BEAM POWER TUBE

Glass octal type used in the output stage of battery-operated receivers. Outline 22, OUTLINES SECTION. Tube requires octal socket. Filament volts (dc), 1.4; amperes, 0.1. For electrical characteristics and ratings, refer to type 3Q5-GT with parallel filament arrangement. Type 1Q5-GT is a DISCONTINUED type for reference only.

PENTAGRID CONVERTER

Miniature type used in lightweight, portable, compact, battery-operated receivers. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. For general discussion of pentagrid types, see Frequency Conversion in ELECTRON TUBE APPLICATIONS SECTION.

NOTE: The transconductance between grid No.1 and grids No.2 and No.4 tied to plate (not oscillating) is approximately 1400 μmhos under the following conditions: grids No.1 and No.3 at 0 volts; grids No.2 and No.4 and plate at 67.5 volts.

POWER PENTODE

Miniature type used in output stage of lightweight, compact, portable, battery-operated equipment. Types 1S4 and 1S5 are identical except for filament arrangement. Outline 11, OUTLINES SECTION. Type 1S4 requires miniature seven-contact socket and may be mounted in any position. For ratings, typical operation, and curves, refer to type 1S4 with parallel filament arrangement. Filament volts (de), 1.4; amperes, 0.1. This type is used principally for renewal purposes.

DIODE—SHARP-CUTOFF PENTODE

Miniature type used in lightweight, compact, portable, battery-operated receivers as combined detector and af voltage amplifier. Outline 11, OUTLINES SECTION. Filament volts (de), 1.4; amperes, 0.05. Tube requires miniature seven-contact socket and may be mounted in any position. For electrical characteristics, curves, and application, refer to type 1U5.

REMOTE-CUTOFF PENTODE

Miniature type used in lightweight, compact, portable, battery-operated receivers as rf or if amplifier. Because of internal shielding feature, an external bulb shield is not needed, but socket shielding is essential if minimum grid-No.1-to-plate capacitance is to be obtained. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

### BEAM POWER TUBE

1T5-GT

Class octal type used in output stage of battery-operated receivers. Outline 22, OUT-LINES SECTION. Tube requires octal socket. Filament volts (dc), 1.4; amperes, 0.05. Typical operation as class A\textsubscript{1} amplifier: plate and grid-No.2 volts, 90 (110 \text{ max}); grid-No.1 volts, -6; peak af grid-No.1 volts, 6; plate ma., 6.5; grid-No.2 ma. (zero-signal), 0.8; grid-No.2 ma. (maximum signal), 1.5; plate resistance, 0.25 \text{ megohm}; transconductance, 1150 \text{ \mu} \text{hos}; load resistance, 14000 ohms; total harmonic distortion, 7.5 per cent; output watts, 0.17. This is a DISCONTINUED type listed for reference only.

### DIODE—SHARP-CUTOFF PENTODE

1T6

Subminiature type used as combined detector and audio amplifier in small, compact, battery-operated receivers for the standard AM broadcast band. Outline 8, OUT-LINES SECTION. Tube requires subminiature eight-contact socket. Filament volts (dc), 1.25; amperes, 0.04. Filament voltage should never exceed 1.6 volts. Typical operation of pentode unit as class A\textsubscript{1} amplifier: plate and grid-No.2 volts, 57.5 \text{ max}; grid-No.1 volts, 0; plate resistance (approx.), 0.4 \text{ megohm}; transconductance, 600 \text{ \mu} \text{hos}; plate ma., 1.6; grid-No.2 ma., 0.4; total cathode ma., 2.0 \text{ max}. Maximum diode plate ma., 0.25. This is a DISCONTINUED type listed for reference only.
SHARP-CUTOFF PENTODE

Miniature type used as rf or if amplifier in stages not controlled by avc in lightweight, compact, portable, battery-operated equipment. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Because the grid No.2 can be operated at the same voltage as the plate, a voltage-dropping resistor is not needed. For typical operation as a resistance-coupled amplifier, refer to Chart 2, RESISTANCE-COUPLED AMPLIFIER SECTION.

FILAMENT VOLTAGE (DC) ............... 1.4 volts
FILAMENT CURRENT .................. 0.05 ampere

Diode unit is located at negative end of filament and is independent of the pentode except for the common filament.

AVERAGE PLATE CHARACTERISTICS
PENTODE UNIT

HALF-WAVE VACUUM RECTIFIER

Glass type used in ac/dc or automobile receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires four-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Maximum ratings as half-wave rectifier: peak inverse plate volts, 1000; peak plate ma, 270; peak heater-cathode volts, 500; dc output ma., 45. This type is used principally for renewal purposes.
HALF-WAVE VACUUM RECTIFIER

Miniature type used in high-voltage, low-current applications such as the rectifier in high-voltage, pulse-operated voltage-doubling power supplies for kinescopes. The very low power required by the filament permits the use of a rectifier transformer having small size and light weight. For curve of average plate characteristics, see page 67.

PULSED-RECTIFIER SERVICE

For operation in a 525-line, 30-frame system

Maximum Ratings:

- DC Inverse Plate Voltage: 6600 max volts
- Peak Inverse Plate Voltage (Absolute Maximum): 8250* max volts
- Peak Plate Current: 10 max ma
- Average Plate Current: 0.5 max ma

* Under no circumstances should this absolute value be exceeded.

INSTALLATION AND APPLICATION

Type 1V2 requires a miniature nine-contact socket and may be mounted in any position. The socket should be made of material having low leakage and should have adequate insulation between its filament and plate terminals to withstand the maximum peak inverse plate voltage. To provide the required insulation in miniature nine-contact sockets designed with a cylindrical center shield, it is necessary to remove the center shield. In addition, it is recommended that the socket clips for pins 1, 6, and 7 be removed to reduce the possibility of arc-over and minimize leakage. Outline 14, OUTLINES SECTION.

The filament is of the coated type and is designed for operation at 0.625 volt. The filament windings on the pulse transformer should be adjusted to provide the rated voltage under average line-voltage conditions. When the filament voltage is measured, it is recommended that an rms voltmeter of the thermal type be used. The meter and its leads must be insulated to withstand 15000 volts and the stray capacitances to ground should be minimized.

The high voltages at which the 1V2 is operated are very dangerous. Great care should be taken to prevent coming in contact with these high voltages. Particular care against fatal shock should be taken in measuring the filament voltage in those circuits where the filament is not grounded. Precautions must include safeguards which definitely eliminate all hazards to personnel.

HALF-WAVE VACUUM RECTIFIER

Miniature types used in high-voltage, low-current applications such as the rectifier in a high-voltage, rf-operated power supply, or as the rectifier of high-voltage pulses produced in television scanning systems. Outlines 16 and 17, respectively, OUTLINES SECTION. Tubes require miniature nine-contact socket and may be mounted in any position. Pins 3 and 7 may be used as tie points for filament dropping resistor and high-voltage filter resistor, or may be connected to the filament. These pins should not be connected to low-potential circuits. For other filament and high-voltage considerations, refer to type 1B3-GT. For curve of average plate characteristics, see page 67. Type 1X2-A is used principally for renewal purposes.

* Grid voltage referred to mid-point of ac-operated filament.

* When a single 2A3 is operated cathode-biased, the cathode-biasing resistor value should be 750 ohms.
INSTALLATION AND APPLICATION

Type 2A3 requires a four-contact socket and may be mounted in any position Outline 51, OUTLINES SECTION. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

The values recommended for push-pull operation are different from the conventional ones usually given on the basis of characteristics for a single tube. The values shown for Push-Pull Class AB1 operation cover operation with fixed bias and with cathode bias, and have been determined on the basis of no grid current flow during the most positive swing of the input signal and of cancellation of second-harmonic distortion by virtue of the push-pull circuit. The cathode resistor should preferably be shunted by a suitable filter network to minimize grid-bias variations produced by current surges in the cathode resistor.

When 2A3's are operated in push-pull, it is desirable to provide means for adjusting the bias on each tube independently. This requirement is a result of the very high transconductance of these tubes (5250 micromhos). This very high value makes the 2A3 somewhat critical as to grid-bias voltage, since a very small bias-voltage change produces a very large change in plate current. It is obvious, therefore, that the difference in plate current between two tubes may be sufficient to unbalance the system seriously. To avoid this possibility, simple methods of independent cathode-bias adjustment may be used, such as (1) input transformer with two independent secondary windings, or (2) filament transformer with two independent filament windings. With either of these methods, each tube can be biased separately so as to obtain circuit balance.

POWER PENTODE

Glass type used in output stage of ac-operated receivers. Outline 43, OUTLINES SECTION. Tubes requires six-contact socket. Except for its heater rating (2.5 volts ac/dc; 1.75 amperes), the 2A5 has electrical characteristics identical with type 6F6. Type 2A5 is a DISCONTINUED type listed for reference only.

TWIN DIODE—HIGH-MU TRIODE

Glass type used in ac-operated receivers chiefly as a combined detector, amplifier, and acv tube. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Except for its heater rating (2.5 volts ac/dc; 0.8 amperes), and within its 250-volt maximum plate rating, the 2A6 has electrical characteristics identical with type 6SQ7. Type 2A6 is a DISCONTINUED type listed for reference only.
PENTAGRID CONVERTER
Glass type used in ac-operated receivers. Outline 40, OUTLINES SECTION. Tube requires small seven-contact (0.75-inch, pin-circle diameter) socket. Except for its heater rating (2.5 volts ac/dc; 0.8 amperes) and its interelectrode capacitances, the 2A7 has electrical characteristics identical with type 6A8. Complete shielding of this tube is generally necessary. Type 2A7 is a DISCONTINUED type listed for reference only.

2A7

MEDIUM-MU TRIODE
Miniature type used as local oscillator in uhf television receivers employing series-connected heater strings. Outline 9, OUTLINES SECTION. Heater volts (ac/dc), 2.35; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6AF4-A.

2AF4-A

TWIN DIODE—REMOTE-CUTOFF PENTODE
Glass type used as combined detector, avc tube, and amplifier. Outline 40, OUTLINES SECTION. Tube requires small seven-contact (0.75-inch, pin-circle diameter) socket. Except for its heater rating (2.5 volts ac/dc; 0.8 amperes) and its interelectrode capacitances, the 2B7 has electrical characteristics identical with type 6B8-G. Type 2B7 is a DISCONTINUED type listed for reference only.

2B7

MEDIUM-MU TRIODE
Miniature type used as rf amplifier in grid-drive circuits of vhf television tuners employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 2.3; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BN4.

2BN4

SHARP-CUTOFF TETRODE
Miniature type used as rf amplifier in vhf tuners of television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 2.4; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6CY5.

2CY5

ELECTRON-RAY TUBE
Glass type used to indicate visually by means of a fluorescent target the effects of a change in a controlling voltage. It is used as a convenient means of indicating accurate radio receiver tuning. Outline 34 or 35, OUTLINES SECTION. Tube requires six-contact socket. Except for its heater rating (2.5 volts ac/dc; 0.8 amperes), the 2E5 has electrical characteristics identical with type 6E5. Type 2E5 is a DISCONTINUED type listed for reference only.

2E5
HALF-WAVE VACUUM RECTIFIER

Miniature type used as rectifier of high-voltage pulses produced in the scanning systems of color television receivers. Outline 16, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. For curve of average plate characteristics, see page 67. For high-voltage considerations, see type 1B3-GT.

**Heater Voltage (ac)**: 3.15 volts
**Heater Current**: 0.22 amperes
**Direct Inter-electrode Capacitance (Approx.):**
- Plate to Heater, Cathode, and Internal Shield: 1.0 μf

**Pulsed-Rectifier Service**
For operation in a 525-line, 30-frame system

**Peak Inverse Plate Voltage**: 18600 max volts
**Peak Plate Current**: 80 max ma
**Average Plate Current**: 1.5 max ma

HALF-WAVE VACUUM RECTIFIER

Glass octal type used as rectifier of high-voltage pulses produced in the scanning systems of color television receivers. Outline 32, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. For curve of average plate characteristics, see page 67. For high-voltage considerations, see type 1B3-GT.

**Heater Voltage (ac)**: 3.15 volts
**Heater Current**: 0.22 amperes
**Direct Inter-electrode Capacitance (Approx.):**
- Plate to Heater, Cathode, and Internal Shield: 1.5 μf

**Pulsed-Rectifier Service**
For operation in a 525-line, 30-frame system

**Peak Inverse Plate Voltage**: 30000 max volts
**Peak Plate Current**: 80 max ma
**Average Plate Current**: 1.5 max ma

DIODE—TRIODE—PENTODE

Glass octal type used as combined detector, af amplifier, and rf amplifier in battery-operated receivers. Maximum over-all length, 3-7/16 inches; maximum diameter, 1-5/16 inches. Filament volts, 1.4 (parallel), 2.8 (series); amperes, 0.1 (parallel), 0.06 (series). Typical operation as class A; amplifier: triode unit—plate volts, 80 (110 max); grid volts, 0; amplification factor, 65; plate resistance, 0.2 megohms; transconductance, 325 μhos; plate ma, 0.2; pentode unit—plate and grid-No.2 volts, 90 (110 max); grid-No.1 volts, 0; plate resistance, 0.8 megohms; transconductance, 750 μhos; plate ma., 1.5; grid-No.2 ma., 0.5. This is a DISCONTINUED type listed for reference only.

**Medium-Mu Triode**

Miniature type used as local oscillator in uhf television receivers covering the frequency range of 470 to 890 megacycles per second and employing series-connected heater strings. Outline 9, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6AF4-A.
TWIN DIODE

Miniature type having high-per-

3AL5

currence used as detector in television
receivers employing series-connected
heater strings. Outline 9, OUTLINES
SECTION. Heater volts (ac/dc), 3.15;
amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this
type is identical with miniature type 6AL5.

SHARP-CUTOFF PENTODE

3AU6

Miniature type used as rf ampli-
fier in television receivers employing
series-connected heater strings. Out-
line 11, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes,
0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts, 200 max. When
the heater is positive with respect to the cathode, the dc component of the heater-
cathode voltage must not exceed 100 volts. Except for heater and heater-cathode
ratings, this type is identical with miniature type 6AU6.

TWIN DIODE—HIGH-MU TRIODE

3AV6

Miniature type used as combined
detector, amplifier, and avc tube in
television receivers employing series-
connected heater strings. Outline 11,
OUTLINES SECTION. Heater volts
(ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-
cathode volts, 200 max. When the heater is positive with respect to the cathode, the
dc component of the heater-cathode voltage must not exceed 100 volts. Except for
heater and heater-cathode ratings, this type is identical with miniature type 6AV6.

HALF-WAVE VACUUM RECTIFIER

3B2

Glass octal type used as rectifier
of high-voltage pulses produced in the
scanning systems of television receivers.
Outline 47, OUTLINES SECTION. Tube requires octal socket and may be
mounted in any position. For curve of average plate characteristics, see page 67.
For high-voltage considerations, see type 1B3-GT.

Heater Voltage (ac/dc) .................................. 3.15 volts
Heater Current ........................................ 0.22 ampere
Direct Inter-electrode Capacitance (Approx.):
Plate to Heater, Cathode, and Internal Shield .................. 1.8 μf

PULSED-RECTIFIER SERVICE

Maximum Ratings: For operation in a 555-line, 30-frame system
Peak Inverse Plate Voltage (Absolute Maximum) ........ 35000 max volts
Peak Plate Current .................................. 80 max ma
Average Plate Current ................................ 1.1 max ma

Under no circumstances should this absolute value be exceeded.

SHARP-CUTOFF PENTODE

3BC5

Miniature type used as rf or if ampli-
fier in television receivers employing
series-connected heater strings. Out-
line 11, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes,
0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts, 200 max. When
the heater is positive with respect to the cathode, the dc component of the heater-cathode voltage must not exceed 100 volts. Except for heater and heater-cathode ratings, this type is identical with miniature type 6BC5.

**BEAM TUBE**

Miniature type used as combined limiter, discriminator, and ac voltage amplifier in intercarrier television and FM receivers employing series-connected heater strings. Outline 13, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts, 200 \( \text{max} \). When the heater is positive with respect to the cathode, the dc component of the heater-cathode voltage must not exceed 100 volts. Except for heater and heater-cathode ratings, this type is identical with miniature type 6BN6.

**SHARP-CUTOFF TWIN PENTODE**

Miniature type used as combined sync separator, sync clipper, and age amplifier tube in television receivers employing series-connected heater strings. Outline 14, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BU8.

**PENTAGRID AMPLIFIER**

Miniature type used as gated amplifier in television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BY6.

**SEMIREMote-CUTOFF PENTODE**

Miniature type used in gain-controlled video if stages of television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts when heater is negative with respect to cathode, 300 \( \text{max} \) (the dc component must not exceed 200 volts). Except for heater and heater-cathode ratings, this type is identical with miniature type 6BZ6.

**SHARP-CUTOFF PENTODE**

Miniature type used as rf or if amplifier in television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts: heater negative with respect to cathode, 300 \( \text{max} \); heater positive with respect to cathode, 200 \( \text{max} \) (the dc component must not exceed 100 volts). Except for heater and heater-cathode ratings, this type is identical with miniature type 6CB6.
SHARP-CUTOFF PENTODE

3CF6

Miniature type used as rf or if amplifier in television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts: heater negative with respect to cathode, 300 max; heater positive with respect to cathode, 200 max (the dc component must not exceed 100 volts). Except for heater and heater-cathode ratings, this type is identical with miniature type 6CF6.

PENTAGRID AMPLIFIER

3CS6

Miniature type used as gated amplifier in television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6CS6.

SHARP-CUTOFF PENTODE

3DT6

Miniature type used as FM detector in television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 3.15; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6DT6.

BEAM POWER TUBE

3LF4

Glass lock-in type used in output stage of ac/dc/battery portable receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Filament volts (dc), 1.4 (parallel), 2.8 (series): amperes, 0.1 (parallel), 0.05 (series). For electrical characteristics, refer to glass-octal type 3Q5-GT. Type 3LF4 is used principally for renewal purposes.

POWER PENTODE

3Q4

Miniature type used in output stage of lightweight, compact, portable battery-operated equipment. Outline 11, OUTLINES SECTION. Except for terminal connections, types 3Q4 and 3V4 are identical. Refer to type 3V4 for ratings, typical operation, and curves.

BEAM POWER TUBE

3Q5-GT

Glass octal type used in output stage of ac/dc/battery portable receivers. Outline 22, OUTLINES SECTION. This type may be supplied with pin No.1 omitted. Tube requires octal socket and may be mounted in any position. For series filament arrangement, filament voltage is applied between pins 2 and 7. For parallel filament arrangement, filament voltage is applied between pin 8 and pins 2 and 7 connected together.
Technical Data

**FILAMENT ARRANGEMENT**
- Series:  
- Parallel:  

**FILAMENT VOLTAGE (DC)**
- Series: 2.8 volts
- Parallel: 1.4 volts

**FILAMENT CURRENT**
- Series: 0.05 amperes
- Parallel: 0.1 amperes

**CLASS A, AMPLIFIER**

**Maximum Ratings:**
- **Series**
  - **PLATE VOLTAGE**: 110 max volts
  - **GRID-No. 2 (SCREEN-GRID) VOLTAGE**: 110 max volts
  - **TOTAL ZERO-SIGNAL CATHODE CURRENT**: 6* max ma

  - **Total Harmonic Distortion**: 12 12 10 12 per cent
  - **Maximum-Signal Power Output**: 160 235 180 270 mw

**Maximum Circuit Values (For maximum rated conditions):**
- **Grid-No.1-Circuit Resistance:**
  - For fixed-bias operation: 2.2 max megohms
  - For cathode-bias operation: 2.2 max megohms
### POWER PENTODE

3V4

Miniature type used in output stage of lightweight, compact, portable, battery-operated equipment. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Except for terminal connections, types 3V4 and 3Q4 are identical. Both feature filament mid-tap so that tubes may be used either with a 1.4-volt battery supply or in series with other miniature tubes having 0.050-ampere filaments. For series filament arrangement, filament voltage is applied between pins 1 and 7 and grid-No.1 voltage is referred to F−. For parallel filament arrangement, filament voltage is applied between pin 5 and pins 1 and 7 connected together and grid-No.1 voltage is referred to Fm, the filament mid-tap.

AVERAGE PLATE CHARACTERISTICS

SHARP-CUTOFF PENTODE

Miniature type used as rf amplifier in television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 4.2; amperes, 0.45; warm-up time (average), 11 seconds. Peak heater-cathode volts: heater negative with respect to cathode, 300 max (the dc component must not exceed 200 volts); heater positive with respect to cathode, 200 max (the dc component must not exceed 100 volts). Except for heater and heater-cathode ratings, this type is identical with miniature type 6AU6.

MEDIUM-MU TWIN TRIODE

Miniature type used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners employing series-connected heater strings. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.2; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BC8.

BEAM TUBE

Miniature type used as combined limiter, discriminator, and audio-voltage amplifier in intercarrier television and FM receivers employing series-connected heater strings. Outline 13, OUTLINES SECTION. Heater volts (ac/dc), 4.2; amperes, 0.45; warm-up time (average), 11 seconds. Peak heater-cathode volts, 200 max. When the heater is positive with respect to the cathode, the dc component of the heater-cathode voltage must not exceed 100 volts. Except for heater and heater-cathode ratings, this type is identical with miniature type 6BN6.
MEDIUM-MU TWIN TRIODE

4BQ7-A

Miniature type used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners employing series-connected heater strings. Outline 12, OUTLINES SECTION.

Heater volts (ac/dc), 4.2; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BQ7-A.

MEDIUM-MU TWIN TRIODE

4BS8

Miniature type used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners employing series-connected heater strings. Outline 12, OUTLINES SECTION.

Heater volts (ac/dc), 4.5; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BS8.

SHARP-CUTOFF TWIN PENTODE

4BU8

Miniature type used as combined sync separator, sync clipper, and agc amplifier tube in television receivers employing series-connected heater strings. Outline 14, OUTLINES SECTION. Heater volts (ac/dc), 4.2; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BU8.

SEMIREMOTE-CUTOFF PENTODE

4BZ6

Miniature type used in gain-controlled video if stages of television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 4.2; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BZ6.

MEDIUM-MU TWIN TRIODE

4BZ7

Miniature type used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners employing series-connected heater strings. Outline 12, OUTLINES SECTION.

Heater volts (ac/dc), 4.2; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BZ7.

SHARP-CUTOFF PENTODE

4CB6

Miniature type used as if and as rf amplifier in television receivers employing series-connected heaterstrings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 4.2; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6CB6.
**Technical Data**

**SHARP-CUTOFF PENTODE**

Miniature type used as FM detector in television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 4.2; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6DT6.

**DIODE—SHARP-CUTOFF PENTODE**

Miniature type used in diversified applications in television receivers employing series-connected heater strings. The pentode unit is used as an amplifier and the high-perveance diode as a detector or dc restorer. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6AM8.

**MEDIUM-MU TRIODE—SHARP-CUTOFF PENTODE**

Miniature type used in a wide variety of applications in television receivers employing series-connected heater strings. The pentode unit is used as an amplifier and the triode unit is used in oscillator or sync circuits. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6AN8.

**BEAM POWER TUBE**

Miniature type used as audio amplifier in television receivers employing series-connected heater strings. Outline 13, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6AQ5-A.

**FULL-WAVE VACUUM RECTIFIER**

Glass octal types used in power supply of television receivers having high dc requirements. Outlines 48 and 38, respectively, OUTLINES SECTION. Type 5AS4-A may be supplied with pins 3, 5, and 7 omitted. Tubes require octal socket. Vertical mounting is preferred, but horizontal mounting is permissible if pins 1 and 4 are in vertical plane. It is especially important that these tubes, like other power-handling tubes, be adequately ventilated. Heater volts (ac), 5.0; amperes, 3.0. For maximum ratings, typical operation, and curves, refer to type 5U4-GB. Type 5AS4 is a DISCONTINUED type listed for reference only.
DIODE—SHARP-CUTOFF PENTODE

5AS8

Miniature type used in diversified applications in television receivers employing series-connected heater strings. The pentode unit is used as an amplifier and the high-

pervenance diode as a detector or dc restorer. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6AS8.

TRIODE—PENTODE CONVERTER

5AT8

Miniature type used as combined oscillator and mixer tube in television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7;

amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts, 200 max. When the heater is positive with respect to the cathode, the dc component of the heater-cathode voltage must not exceed 100 volts. Except for heater and heater-cathode ratings, this type is identical with miniature type 6AT8.

MEDIUM-MU TRIODE—SHARP-CUTOFF PENTODE

5AV8

Miniature type used in a wide variety of applications in television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7;

amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating and basing arrangement, this type is identical with miniature type 6AN8.

FULL-WAVE VACUUM RECTIFIER

5AZ4

Lock-in type used in power supply of radio equipment having moderate dc requirements. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Filament volts, 5; amperes, 2. For maximum ratings, typical operation, and curves, refer to glass-sockettype 5Y3-GT. Type 5AZ4 is used principally for renewal purposes.

MEDIUM-MU TRIODE—SHARP-CUTOFF PENTODE

5B8

Miniature type used as combined vhf oscillator and mixer in television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

Heater Voltage (ac/dc) ................................................................. 4.7 volts

**MEDIUM-MU TWIN TRIODE**

Miniature type used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners utilizing series-connected heater strings. Outline 12, OUTLINES SECTION.

Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature types 6BK7-A and 6BK7-B.

---

**MEDIUM-MU TWIN TRIODE**

Miniature type used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners employing series-connected heater strings. Outline 12, OUTLINES SECTION.

Heater volts (ac/dc), 5.6; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BK7-A.

---

**MEDIUM-MU TRIODE—SHARP-CUTOFF PENTODE**

Miniature type used in a wide variety of applications in color and black-and-white television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6BR8.
TWIN DIODE—SHARP-CUTOFF PENTODE

5BT8

Miniature type used in a variety of applications in television receivers employing series-connected heater strings. The pentode unit is used as an if amplifier, video amplifier, a/c amplifier, or reactance tube. The diode unit is used in automatic-frequency-control and detector circuits. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

TRIODE-PENTODE CONVERTER

5CG8

Miniature type used as combined oscillator and mixer tube in television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater voltage, this type is identical with miniature type 6CG8.

MEDIUM-MU TRIODE—SHARP-CUTOFF TETRODE

5CL8

5CL8-A

Miniature types used as combined vhf oscillator and mixer in television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater voltage, these types are identical with miniature types 6CL8 and 6CL8-A. Type 5CL8 is a DISCONTINUED type listed for reference only.

108
MEDIUM-MU TRIODE—SHARP-CUTOFF TETRODE

Miniature type used in a wide variety of applications in color and black-and-white television receivers employing series-connected heater strings. The tetrode unit is used as a mixer or amplifier and the triode unit is used in oscillator and rf amplifier circuits. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6CQ8.

BEAM POWER TUBE

Miniature type used as vertical deflection amplifier and as audio output tube in television and radio receivers employing series-connected heater strings. Outline 18, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6CZ5.

MEDIUM-MU TWIN TRIODE

Miniature type used as combined rf power amplifier and oscillator in television receivers employing series-connected heater strings. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts, 200 max. When the heater is positive with respect to the cathode, the dc component of the heater-cathode voltage must not exceed 100 volts. Except for heater and heater-cathode ratings, this type is identical with miniature type 6J6.

FULL-WAVE VACUUM RECTIFIER

Metal type used in power supply of radio equipment having large dc requirements. Outline 7, OUTLINES SECTION. Tube requires octal socket. Vertical tube mounting is preferred but horizontal mounting is permissible if pins 2 and 8 are in vertical plane. Filament volts (ac), 5.0; amperes, 2.0. Maximum ratings as full-wave rectifier: peak inverse plate volts, 1550 max; peak plate ma., 675 max; dc output ma., 225 max. This type is used principally for renewal purposes.

† When a filter-input capacitor larger than 40 μf is used, it may be necessary to use more plate-supply impedance than the value shown in order to limit the peak plate current to the rated value.
TRIPLE DIODE—HIGH-MULTIPLIER

5T8

Miniature type used as combined AM detector, FM detector, and audio amplifier in radio and television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 4.7; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts, 200 max. When the heater is positive with respect to the cathode, the dc component of the heater-cathode voltage must not exceed 100 volts. Except for heater and heater-cathode ratings, this type is identical with miniature type 6T8.

FULL-WAVE VACUUM RECTIFIER

5U4-G

Glass octal types used in power supplies of radio and television receivers having high dc requirements. 5U4-G Outline 50, 5U4-GB Outline 44, OUTLINES SECTION. Tubes require octal socket. Vertical mounting is preferred but horizontal mounting is permissible if pins 1 and 4 are in vertical plane. The coated filament is designed to operate from the ac line through a step-down transformer. The voltage at the filament terminals should be 5.0 volts at an average line voltage of 117 volts. It is especially important that these tubes, like other power-handling tubes, be adequately ventilated. For discussion of Rating Chart and Operation Characteristics, refer to INTERPRETATION OF TUBE DATA. Maximum ratings for type 5U4-G as full-wave rectifier: peak inverse plate volts, 1550 max; peak plate ma. per plate, 675 max. Type 5U4-G is used principally for renewal purposes.

| 15  | 15  | volts |

#If hot switching is regularly required in operation, the use of choke-input circuits is recommended. Such circuits limit the hot-switching current to a value no higher than that of the peak plate current.

110
When capacitor-input circuits are used, a maximum peak current value per plate of 4.6 amperes during the initial cycles of the hot-switching transient should not be exceeded.

Higher values of capacitance than indicated may be used, but the effective plate-supply impedance may have to be increased to prevent exceeding the maximum rating for peak plate current.

For load currents less than 35 ma, a larger value of inductance is required for optimum regulation.

# # This value is adequate to maintain optimum regulation in the region to the right of line L=10H on curve OPERATION CHARACTERISTICS with Choke Input to Filter, provided the load current is not less than 50 ma. For load currents less than 50 ma, a larger value of inductance is required for optimum regulation.

FULL-WAVE VACUUM RECTIFIER

Glass octal types used in power supplies of radio equipment having moderate dc requirements. 5Y4-G Outline 42, 5Y4-GT Outline 25, OUTLINES SECTION. Tubes require octal socket. Type 5Y4-GT is supplied with pins No.4 and No.6 missing. Vertical tube mounting is preferred, but horizontal operation is permissible if pins No.2 and No.7 are in horizontal plane. Filament volts (ac), 5.0; amperes, 2.0. For maximum ratings, typical operation, and curves, refer to type 5Y3-GT. It is especially important that these tubes, like other power-handling tubes, be adequately ventilated. Type 5Y4-G is a DISCONTINUED type listed for reference only.

FULL-WAVE VACUUM RECTIFIER

Glass type used in power supply of radio equipment having large dc requirements. Outline 51, OUTLINES SECTION. Tube requires four-contact socket. Vertical mounting is preferred but horizontal mounting is permissible if pins 1 and 4 are in horizontal plane. Filament volts (ac), 5.0; amperes, 3.0. For maximum ratings, refer to type 5U4-G. Type 5Z3 is used principally for renewal purposes.

FULL-WAVE VACUUM RECTIFIER

Metal type used in power supply of radio equipment having moderate dc requirements. Outline 6, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Heater volts (ac), 5.0; amperes, 2.0. Maximum ratings: peak inverse plate volts, 1400 max; peak plate ma. per plate, 375 max. Typical operation as full-wave rectifier with capacitor-input filter: ac plate-to-plate supply volts (rms), 700; total effective plate-supply impedance per plate, 50 ohms; dc output ma., 125. Typical operation with choke-input filter: ac plate-to-plate supply volts, 1000; minimum filter-input choke, 5 henries; dc output ma., 125.
POWER TRIODE

Glass type used in output stage of radio receivers. Outline 51, OUTLINES SECTION. Tube requires four-contact socket. Filament volts (ac/dc), 6.3; amperes, 1.0. This type is identical electrically with type 634-G. Type 6A5 is a DISCONTINUED type listed for reference only.

POWER PENTODE

Glass type used in output stage of automobile receivers. Outline 43, OUTLINES SECTION. Tube requires five-contact socket. Filament volts (ac/dc), 6.3; amperes, 0.3. Typical operation: plate and grid-No. 2 volts, 180 max; grid-No. 1 volts, -12; plate ma., 22; grid-No. 2 ma., 3.9; plate resistance, 45500 ohms approx.; transconductance, 2200 μmhos; load resistance, 8000 ohms; cathode-bias resistor, 465 ohms; output watts, 1.4. This is a DISCONTINUED type listed for reference only.

HIGH-MU TWIN POWER TRIODE

Glass type used in output stage of ac-operated receivers as a class B power amplifier or with units in parallel as a class A amplifier to drive a 6A6 as class B amplifier. Outline 43, OUTLINES SECTION. Tube requires medium seven-contact (0.855-inch, pin-circle diameter) socket. Filament volts (ac/dc), 6.3; amperes, 0.8. This type is electrically identical with type 6N7. Type 6A6 is a DISCONTINUED type listed for reference only.

PENTAGRID CONVERTER

Glass types used in superheterodyne circuits. Outline 40, OUTLINES SECTION. These types require the small seven-contact (0.75-inch, pin-circle diameter) socket. Except for interelectrode capacitances, the 6A7 is identical electrically with type 6A8. Type 6A7S, now DISCONTINUED, has the external shield connected to cathode. In general, its electrical characteristics are similar to those of the 6A7, but the two types are usually not directly interchangeable. Type 6A7 is used principally for renewal purposes.

PENTAGRID CONVERTER

Metal type 6A8 and glass octal types 6A8-G and 6A8-GT used in superheterodyne circuits. 6A8 Outline 4, 6A8-G Outline 39, 6A8-GT Outline 28, OUTLINES SECTION. Tubes require octal socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Maximum ratings: plate, grids-No.3 and No.5 supply; and grid-No.2 supply volts, 300 max; grids-No.3-and-No.5 (screen-grid) volts, 100 max; grid-No.2 (anode-grid) volts, 200 max; grid-No.4 (control-grid) volts, 0 max; plate dissipation, 1 watt; grids-No.3-and-No.5 input, 0.3 max watt; grid-No.2 input, 0.75 max watt; total cathode ma., 14 max; peak heater-cathode volts, 90 max. These types are used principally for renewal purposes.

* Grid-No. 2 supply voltages in excess of 200 volts require use of 20000-ohm voltage-dropping resistor bypassed by 0.1-uF capacitor.

HIGH-MU TRIODE
Miniature type used as cathode-drive amplifier, frequency converter, or oscillator at frequencies up to about 300 megacycles per second particularly in television and FM receivers. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.15. For maximum ratings, characteristics, and curves, refer to type 12AT7.

ELECTRON-RAY TUBE
Glass type used to indicate visually by means of a fluorescent target the effects of a change in a controlling voltage. It is used as a convenient means of indicating accurate radio-receiver tuning. Outline 34, OUTLINES SECTION. Tube requires six-contact socket. For heater and cathode considerations, refer to type 6AV6. Heater volts (ac/dc), 6.3; amperes, 0.15. Ratings: plate-supply volts, 180 max; target volts, 150 max, 125 min. This type is used principally for renewal purposes.

REMOTE-CUTOFF PENTODE
Metal type used in rf and if stages of picture amplifier of television receivers particularly those employing automatic-gain control. Outline 3, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.45. Maximum ratings as class A amplifier: plate and grid-No. 2 supply volts, 300 max; grid-No.2 volts, 200 max; plate dissipation, 3.75 max watts; grid-No.2 input; 0.7 max watt. Typical operation: plate and grid-No.2 supply volts, 300; grid-No.3 volts, 0; grid-No.2 series resistor, 3000 ohms; grid-No.1 volts, -3; plate resistance (approx.), 0.7 megohm; transconductance, 5000 µmhos; grid-No.1 volts for transconductance of 50 µmhos, -15; plate ma., 12.5; grid-No.2 ma., 3.2. This type is used principally for renewal purposes.

HIGH-MU POWER TRIODE
Glass octal type used in single-ended or push-pull audio-frequency power amplifiers of the direct-coupled type in which a driver tube develops positive grid bias for the 6AC5-GT output stage. Outline 22, OUTLINES SECTION. This type may be supplied with pin No. 1 omitted. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.4. Maximum ratings: plate volts, 250 max; peak plate ma. (per tube) 110 max; average plate dissipation, 10 max watts. This type is used principally for renewal purposes.

SHARP-CUTOFF PENTODE
Metal type used in rf and if stages of picture amplifier and the first stages of the video amplifier of television receivers. It is also used as a mixer or oscillator tube in low-frequency applications. Outline 3, OUTLINES SECTION. Tube requires octal socket. When tube is used as a high-gain audio amplifier, heater should be operated from a battery source.
HEATER VOLTAGE (ac/dc) ........................................ 6.3 volts
HEATER CURRENT ........................................... 0.45 ampere

Maximum Ratings: CLASS A, AMPLIFIER

PLATE VOLTAGE ........................................... 300 max volts
GRID-No.2 (SCREEN-GRID) VOLTAGE ...................... See curve page 69
GRID-No.2 SUPPLY VOLTAGE ................................ 300 max volts
PLATE DISSIPATION .......................................... 3 max watts
GRID-No.2 INPUT:
For grid-No.2 voltages up to 150 volts ........................ 0.4 max watt
For grid-No.2 voltages between 150 and 300 volts ...... See curve page 69

PEAK HEATER-CATHODE VOLTAGE:
Heater negative with respect to cathode ........................ 90 max volts
Heater positive with respect to cathode ........................ 90 max volts

Characteristics:

Plate Supply Voltage .................................. 300 volts
Grid-No. 3 Voltage ........................................ 150 volts
Grid-No. 2 Supply Voltage ......................... 200 volts
Grid-No. 2 Series Resistor .......................... 60000 ohms
Min. Cathode-Bias Resistor ......................... 160 ohms
Plate Resistance (Approx.) .......................... 9000 microhms
Transconductance ...................................... 1000 microhms
Plate Current ............................................ 10 ma
Grid-No.2 Current ........................................ 2.5 ma

Maximum Circuit Values:

Grid-No.1-Circuit Resistance:
For cathode-bias operation with fixed grid-No.2 voltage .... 0.25 max megohm
For cathode-bias operation with grid-No.2 resistor ......... 0.50 max megohm

# Grid-No.2 supply voltages in excess of 150 volts require use of a series dropping resistor to limit the voltage at grid No. 2 to 150 volts when the plate current is at its normal value of 10 milliamperes.

ELECTRON-RAY TUBE

Glass octal type used to indicate visually, by means of two shadows on the fluorescent target, the effects of changes in the controlling voltages. It is a twin-indicating type and is used as a convenient means of indicating accurate radio-receiver tuning. Maximum over-all length, 2-7/8 inches; maximum diameter, 1-5/16 inches. Heater volts (ac/dc), 6.3; amperes, 0.15. Maximum target volts, 150. This is a DISCONTINUED type listed for reference only.

TRIODE—POWER PENTODE

Glass octal type used in a push-pull amplifier circuit in conjunction with type 6F6-G. Triode unit serves as phase inverter. Outline 42, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.85. For typical operation of pentode unit, refer to type 6F6-G. Maximum ratings of pentode unit as class A1 or push-pull class AB1; amplifier: plate volts, 375 max; grid-No. 2 volts, 285 max; plate dissipation, 8.5 max watts; grid-No.2 input, 2.7 max watts. Maximum ratings of triode unit as class A1 amplifier: plate volts, 285 max; plate dissipation, 1.0 max watt. This type is used principally for renewal purposes.

LOW-MU TRIODE

Glass octal type used as class A1 amplifier in ac/dc radio receivers. Outline 22, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.3. Maximum ratings as class A1 amplifier: plate volts, 300 max; plate dissipation, 2.5 max watts. This is a DISCONTINUED type listed for reference only.

TWIN-PLATE CONTROL TUBE

Glass octal type used as a control tube for twin-indicating type electron-ray tubes. Outline 36, OUTLINES SECTION. Contains two triodes with different cutoff characteristics. If avc voltage is applied to the common control grid in suitable circuit, one triode section operates on weak signals while the other operates on strong signals. Heater voltage (ac/dc), 6.3; amperes, 0.15. This is a DISCONTINUED type listed for reference only.

118
**Technical Data**

**TWIN-INPUT TRIODE**

Glass octal type used as a voltage amplifier or as a driver for two type 6AC5-GT tubes in dynamic-coupled, push-pull amplifiers. In the latter service, type 6AE7-GT replaces two tubes ordinarily required as drivers. Outline 22, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.5. This is a DISCONTINUED type listed for reference only.

**6AE7-GT**

**MEDIUM-MU TRIODE**

Miniature types used as local oscillators in uhf television receivers covering the frequency range of 470 to 890 megacycles per second. 6AF4 Outline 11, 6AF4-A Outline 9, OUTLINES SECTION. Tubes require miniature seven-contact socket and may be mounted in any position.

119
Typical Operation as Oscillator at 950 Mc:
Plate Supply Voltage ................................................................. 100 volts
Plate Resistor .............................................................................. 220 ohms
Grid Resistor .............................................................................. 10000 ohms
Plate Current ................................................................................ 17 ma
Grid Current (Approx.) ............................................................... 750 μa

Maximum Circuit Values:
Grid-Circuit Resistance: Not recommended
For fixed-bias operation ................................................................. 0.5 max megohm
For cathode-bias operation

* It is recommended that the heater be kept at cathode potential to minimize the effects of variation in
the heater-to-cathode capacitance between tubes.
* The dc component must not exceed 25 volts.

ELECTRON-RAY TUBE
6AF6-G
Glass octal type used to indicate visually, by means of two shadows on
the fluorescent target, the effects of changes in the controlling voltages. It
is a twin-indicator type and is used as
a convenient means of indicating accurate radio-receiver tuning. Maximum over-all
length, 2-5/16 inches; maximum diameter, 1-9/32 inches. This type may be sup-
plied with pin No.1 omitted. Tube requires octal socket. Heater volts (ac/dc), 6.3;
amperes, 0.15. Ratings: target volts, 250 max, 125 min; ray-control-electrode sup-
ply volts, 250 max; peak heater-cathode volts, 90 max. Typical operation: target
volts, 250; target ma., 2.2; series resistor, 1 megohm; ray-control-electrode volts
(approx. for 0° shadow angle), 160; ray-control-electrode volts (approx. for 90°
shadow angle), 0.

SHARP-CUTOFF PENTODE
6AG5
Miniature type used in compact
radio equipment as an rf or if amplifier
up to 400 megacycles per second.
Outline 11, OUTLINES SECTION.
Tube requires miniature seven-con-
tact socket and may be mounted in any position. Except for a slightly lower trans-
conductance, this type is similar electrically to miniature type 6BC5. Heater volts
(ac/dc), 6.3; amperes, 0.3.

POWER PENTODE
6AG7
Metal type used in output stage
of video amplifier of television receiv-
ers. Outline 6, OUTLINES SECTION.
Tube requires octal socket. Heater vol-
s (ac/dc), 6.3; amperes, 0.65. Max-
imum ratings as class A; video voltage amplifier: plate volts, 300 max; grid-No.2
volts, 300 max; plate dissipation, 9.0 max watts; grid-No.2 input, 1.5 max watts.
Typical operation as a class A1 amplifier: plate volts, 300; grid-No.2 volts, 150;
gird-No.1 volts, -3; peak af grid-No.1 volts, 3; zero-signal plate ma., 30; maximum-
signal plate ma., 30.5; zero-signal grid-No.2 ma., 7; maximum-signal grid-No.2
ma., 9; plate resistance, 130000 ohms; transconductance, 11000 μmhos; load
resistance, 10000 ohms; total harmonic distortion, 7 per cent; maximum-signal output watts, 3.

MEDIUM-MU TRIODE
6AH4-GT
Glass octal type having high permeance
used as vertical deflection amplifier in television
receivers. Outline 22, OUTLINES SECTION.
Tube requires octal socket and may be mounted
in any position. Heater volts (ac/dc), 6.3; am-
peres, 0.75. Characteristics as class A1 amplifier:
plate volts, 250; grid volts, -23; amplification
factor, 8; plate resistance (approx. ), 1780 ohms;
transconductance, 4500 μmhos; plate ma., 30. This
type is used principally for renewal purposes.
**Technical Data**

**VERTICAL DEFLECTION AMPLIFIER**

*For operation in a 525-line, 30-frame system*

TWIN DIODE

Miniature, high-perveance type used as detector in FM and television circuits. It is especially useful as a ratio detector in ac-operated FM receivers. Each diode section can be used independently of the other, or the two sections can be combined in parallel or full-wave arrangement. Resonant frequency of each unit is approximately 700 megacycles per second. Outline 9, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

HEATER VOLTAGE (ac/dc) .................................... 6.3 volts

**Technical Data**

**ELECTRON-RAY TUBE**

Glass octal type used to indicate visually on a pair of rectangular fluorescent patterns the effects of changes in voltages applied to its grid and three deflecting electrodes. It is especially useful in meeting the requirements for accurate tuning in FM receivers. Outline 22, OUTLINES SECTION, except over-all length is 3-1/16 max inches and seated height is 2-1/2 max inches. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.15. Ratings: target volts, 365 max, 220 win; peak heater-cathode volts, 90 max. Typical operation in indicator service: target volts, 315; deflecting electrodes Nos. 1, 2, and 3 volts, 0; cathode resistor (approx.), 3300 ohms; deflection sensitivity (approx.), 1 mm/volt; grid volts for fluorescence cutoff, -7. This type is used principally for renewal purposes.

**HIGH-MU TRIODE**

Miniature type used as mixer and rf amplifier in cathode-drive circuits of uhf television receivers. Outline 10, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

### Heater Voltage (AC/DC)

6.3 volts

### Heater Current

AVERAGE PLATE CHARACTERISTICS

PENTODE UNIT

AVERAGE PLATE CHARACTERISTICS

TRIODE UNIT
Technical Data

Characteristics:
- Plate Supply Voltage: 200 volts
- Grid-No.2 Supply Voltage: 150 volts
- Grid-No.1 Voltage: -6 volts
- Cathode-Bias Resistor: 180 ohms
- Amplification Factor: 19
- Plate Resistance (Approx.): 57,500 ohms
- Transconductance: 3,300 μhos
- Grid-No.1 Voltage (Approx.) for plate current of 10 mA: -19 volts
- Plate Current: 1.8 ma
- Grid-No.2 Current: 2.8 ma

Maximum Circuit Values:
- Grid-No.1-Circuit Resistance: 0.5 max, 0.25 max megohm
- For fixed-bias operation: 1.0 max, 1.0 max megohm

*The dc component must not exceed 100 volts.

*If either unit is operating at maximum rated conditions, grid-No.1-circuit resistance for both units should not exceed the stated values.

BEAM POWER TUBE

Miniature types used as output amplifiers primarily in automobile receivers and in ac-operated receivers and, triode-connected, as vertical deflection amplifiers in television receivers. Type 6AQ5-A has a controlled heater warm-up time for use in television receivers employing series-connected heater strings. Outline 13, OUTLINES SECTION. Tubes require miniature seven-contact socket and may be mounted in any position. Within their maximum ratings, the performance of these types is equivalent to that of larger types 6V6 and 6V6-GT. For typical circuits employing type 6AQ5-A, both singly and in push-pull, refer to CIRCUITS SECTION. Type 6AQ5 is a DISCONTINUED type listed for reference only.

**6AQ5**

**6AQ5-A**

Maximum Ratings:

**CLASS A. AMP LiER**

- Plate Voltage: 250 max volts
- Grid-No.2 (screen-grid) Voltage: 250 max volts
TWIN DIODE—HIGH-MU TRIODE

Miniature type used as a combined detector, amplifier, and arc tube in compact radio receivers. This type is similar to metal type 6Q7 in many of its electrical characteristics. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. For typical operation as resistance-coupled amplifier, refer to Chart 5, RESISTANCE-COUPLED AMPLIFIER SECTION.

**DIODE UNITS**

Two diode plates are placed around a cathode, the sleeve of which is common to the triode unit. Diode biasing of the triode unit of the 6AQ5 is not suitable. For diode operation curves, refer to type 6AV6.

**AVERAGE PLATE CHARACTERISTICS**

![AVERAGE PLATE CHARACTERISTICS](chart)

**TWIN DIODE—HIGH-MU TRIODE**

Glass octal type used as FM detector and audio amplifier in circuits which require diode and triode units with separate cathodes. Outline 22, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Ratings and characteristics of triode unit as class A; amplifier: plate volts, 250 max; grid volts, -2; amplification factor, 70; plate resistance (approx.), 4000 ohms; transconductance, 1600 μmhos; plate ma., 2.3. For typical operation as a resistance-coupled amplifier, refer to Chart 5, RESISTANCE-COUPLED AMPLIFIER SECTION. This type is used principally for renewal purposes.

**POWER PENTODE**

Miniature type used as output tube primarily in automobile receivers and ac-operated receivers. Outline 13, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.4. Maximum ratings as class A; amplifier: plate and grid-No.2 (screen-grid) volts, 250 max; plate dissipation, 8.5 max watts; grid-No.2 input, 2.5 max watts; peak heater-cathode volts, 90 max. Within its maximum ratings, type 6AR5 is equivalent in performance to glass-octal type 6K6-GT. Type 6AR5 is used principally for renewal purposes.
BEAM POWER TUBE

Miniature type used as output amplifier primarily in automobile and in ac-operated receivers. Outline 13, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. For curves of average plate characteristics, refer to type 35C5.

- **Plate Dissipation:** 2.5 max watts
- **Grid-No.2 Input:**
  - For grid-No.2 voltages up to 150 volts: 0.5 max watts
  - For grid-No.2 voltages between 150 and 300 volts: See curve page 69
- **Peak Heater-Cathode Voltage:**
  - Heater negative with respect to cathode: 200 max volts
  - Heater positive with respect to cathode: 200° max volts

**Characteristics:**
- **Plate Supply Voltage:** 300 volts
- **Grid No.3:** Connected to cathode at socket
- **Grid-No.2 Supply Voltage:** 150 volts
- **Cathode-Bias Resistor:** 150 ohms
- **Plate Resistance (Approx.):** 300000 ohms
- **Transconductance:** 6200 µmhos
- **Grid-No.1 Voltage (Approx.) for plate current of 10 µa:** -8 volts
- **Plate Current:** 9.5 ma
- **Grid-No.2 Current:** 3 ma

**Maximum Circuit Values (For maximum rated conditions):**
- **Grid-No.1-Circuit Resistance:**
  - For fixed-bias operation: 0.25 max megohm
  - For cathode-bias operation: 1.0 max megohm
- *The dc component must not exceed 100 volts.*

**Maximum Ratings:**
- **DIODE UNIT**
- **Peak Inverse Plate Voltage:** 330 max volts
- **Peak Plate Current:** 50 max ma
- **DC Plate Current:** 5 max ma
- **Peak Heater-Cathode Voltage:**
  - Heater negative with respect to cathode: 200 max volts
  - Heater positive with respect to cathode: 200° max volts
- *The dc component must not exceed 100 volts.*

---

**TWIN DIODE—HIGH-MU TRIODE**

Miniature type used as a combined detector, amplifier, and a.v.c. tube in automobile and a.c. operated radio receivers. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. For typical operation as resistance-coupled amplifier, refer to Chart 5, RESISTANCE-COUPLED AMPLIFIER SECTION.

**Heater Voltage (AC/DC):** 6.3 volts
**Heater Current:** 9.3 ampere
**Direct Inter-electrode Capacitances:**
- Triode Grid to Triode Plate: 2.0 µµf
- Triode Grid to Cathode and Heater: 2.2 µµf
- Triode Plate to Cathode and Heater: 0.8 µµf
- Plate of Diode Unit No.2 to Triode Grid: 0.04 max µµf

**Maximum Ratings:**
- **TRIODE UNIT AS CLASS A1 AMPLIFIER**
  - **Plate Voltage:** 300 max volts
  - **Plate Dissipation:** 0.5 max watts
  - **Grid Voltage, Positive Bias Value:** 0 max volts
  - **Peak Heater-Cathode Voltage:**
    - Heater negative with respect to cathode: 90 max volts
    - Heater positive with respect to cathode: 90 max volts

**Characteristics:**
- **Plate Voltage:** 100-250 volts
- **Grid Voltage:** -1 to -3 volts
- **Amplification Factor:** 70
- **Plate Resistance:** 54000 ohms
- **Transconductance:** 1300 µµhos
- **Plate Current:** 0.8 ma

**Maximum Rating:**
- **DIODE UNITS**
  - **Plate Current (Each Unit):** 1.0 max ma

The two diode plates are placed around a cathode, the sleeve of which is common to the triode unit. Each diode plate has its own base pin. For diode operation curvcs, refer to type 6AV6.

131
TRIODE-PENTODE CONVERTER

6AT8
6AT8-A

Miniature types used as combined oscillator and mixer tubes in television receivers utilizing an intermediate frequency in the order of 40 megacycles per second. Type 6AT8-A has a controlled heater warm-up time for use in receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Except for interelectrode capacitances and basing arrangement, these types are identical with miniature type 6X8. The basing arrangement of the GAT8 and GAT8-A is particularly suitable for connection to the coils of certain designs of turret tuners.

Heater Voltage (AC/DC) ........................................... 6.3 volts

### Medium-Mu Twin Triode

Miniature type used as phase triode or amplifier in television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Heater volts (ac or dc), 12.6 (series), 6.9 (parallel); amperes, 0.15 (series), 0.3 (parallel); warm-up time (average) in parallel arrangement, 11 seconds. Except for heater and heater-cathode ratings, this type is identical with miniature type 12AU7. The 6AU7 is a DISCONTINUED type listed for reference only.

### Medium-Mu Triode—Sharp-Cutoff Pentode

Miniature type used in a wide variety of applications in television receivers. This type has a controlled heater warm-up time for use in receivers employing series-connected heater
strings. The pentode unit is used as a video amplifier, an if amplifier, or an AGC amplifier. The triode unit is used in sync-amplifier, sync-separator, sync-clipper, and phase-inverter circuits. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

- **HEATER VOLTAGE (AC/DC):** 6.3 volts
- **HEATER CURRENT:** 0.6 ampere
- **HEATER WARM-UP TIME (Average):** 11 seconds

**DIRECT INTERELECTRODE CAPACITANCES:**

The two diode plates are placed around a cathode, the sleeve of which is common to the triode unit. Each diode plate has its own base pin. Diode biasing of the triode unit is not recommended.

INSTALLATION AND APPLICATION

Type 6AV6 requires miniature seven-contact socket and may be mounted in any position. Outline 11, OUTLINES SECTION.

The triode unit of the 6AV6 is recommended for use only in resistance-coupled circuits. Refer to the RESISTANCE-COUPLED AMPLIFIER SECTION, Chart 15 for typical operating conditions.

Grid bias for the triode unit of the 6AV6 may be obtained from a fixed source, such as a fixed-voltage tap on the dc power supply, or from a cathode-bias resistor. It should not be obtained by the diode-biasing method because of the probability of plate-current cutoff, even with relatively small signal voltages applied to the diode circuit.
BEAM POWER TUBE

Glass octal types used as horizontal deflection amplifiers in television receivers employing either transformer coupling or direct coupling to the deflecting yoke. 6AV5-GA

Outline 33, 6AV5-GT Outline 22, OUTLINES SECTION. Tubes require octal socket and may be mounted in any position. Type 6AV5-GT is a DISCONTINUED type listed for reference only.

#The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

* Under no circumstances should this absolute value be exceeded.

- The dc component must not exceed 900 volts.
- The dc component must not exceed 100 volts.
FULL-WAVE VACUUM RECTIFIER

Glass octal type used in power supply of radio equipment having moderate dc requirements. Outline 22, OUTLINES SECTION. This type may be supplied with pin No.1 omitted.

Tube requires octal socket and may be mounted in any position. The heater of this tube can be operated from the same transformer winding that supplies other 6.3-volt tubes in the receiver. In addition, because its heater-cathode construction gives the same heating time as that of other heater-cathode types in the receiver, use of the 6AX5-GT prevents excessive voltages from appearing across filter capacitors during warmup, and, as a result, permits the use of electrolytic filter capacitors having lower peak voltage ratings than required for a filament-type rectifier tube. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

**AVERAGE PLATE CHARACTERISTICS**

**TRIODE UNIT**

TYPE 6AZ5

\(E_p = 6.3\) Volts

[Graph showing average plate characteristics]
POWER TRIODE

Glass octal type used in output stage of radio receivers and amplifiers. Outline 50, OUTLINES SECTION. Tube requires octal socket. For typical operation as a single-tube class A amplifier, refer to type 2A8. Filament volts (ac/dc), 6.3; amperes, 1.0. Maximum ratings as push-pull class AB amplifier: plate volts, 325; plate dissipation, 15 watts. Type 6B4-G is a DISCONTINUED type listed for reference only.

6B4-G

DIRECT-COUPLED POWER TRIODE

Glass type used as class A1 power amplifier. One triode, the driver, is directly connected within the tube to the second, or output, triode. Outline 43, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.8. Characteristics of input and output triodes as class A amplifier follow. Input triode: plate volts, 300 max; grid volts, 0; plate ma., 8. Output triode: plate volts, 300 max; plate ma., 45; plate resistance, 24000 ohms; load resistance, 7000 ohms; output watts, 4. This is a DISCONTINUED type listed for reference only.

6B5

TWIN-DIODE—HIGH-MU TRIODE

Glass octal type used as combined detector, amplifier, and a/vc tube. Outline 39, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 9.3. Within its triode maximum plate-voltage rating of 250 volts, this type is similar electrically to type 6SQ7 and curves under that type apply to the 6B6-G. This is a DISCONTINUED type listed for reference only.

6B6-G

TWIN-DIODE—REMOTE-CUTOFF PENTODE

Glass types used as combined detector, amplifier, and a/vc tube. Outline 40, OUTLINES SECTION. These types fit the small seven-contact (0.75-inch, pin-circle diameter) socket. Except for interelectrode capacitances, the electrical characteristics of the 6B7 are identical with those of type 6B8-G. Type 6B7S has the external shield connected to the cathode. In general, its electrical characteristics are similar to those of the 6B7, but the two types are usually not directly interchangeable. These are DISCONTINUED types listed for reference only.

6B7

6B7S

144
**Technical Data**

**TWIN-DIODE—REMOTE-CUTOFF PENTODE**

Metal type 6B8 and glass octal type 6B8-G are used as combined detector, amplifier, and a.v.c. tubes. Outlines 4 and 39, respectively, OUTLINES SECTION. Type 6B8 is used principally for renewal purposes; 6B8-G is a DISCONTINUED type listed for reference only. Tubes require octal socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Maximum ratings of pentode unit as class A; amplifier: plate volts, 300 max; grid-No.2 volts, 125 max; grid-No.2 supply volts, 300 max; grid-No.1 volts, 0 min; plate dissipation, 3.0 max watts (6B8), 2.25 max watts (6B8-G); grid-No.2 input, 0.3 max watt.

**REMOTE-CUTOFF PENTODE**

Miniature type used as rf amplifier in standard broadcast and FM receivers, as well as in wide-band, high-frequency applications. This type is similar in performance to metal type 6SG7. The low value of grid-No.1-to-plate capacitance minimizes regenerative effects, while the high transconductance makes possible high signal-to-noise ratio.

**HEATER VOLTAGE (ac/dc)**

6.3 volts

**HEATER CURRENT**

0.3 amperes

**DIRECT INTERELECTRODE CAPACITANCES**

Grid No.1 to Plate: 0.0635 max µf

Grid No.1 to Cathode, Heater, Grid No.2, Grid No.3, and Internal Shield: 5.5 µf

Plate to Cathode, Heater, Grid No.2, Grid No.3, and Internal Shield: 5.0 µf

**GRID-NO.2 INPUT:**

- For grid-No.2 voltages up to 150 volts.
- For grid-No.2 voltages between 150 and 300 volts.

**GRID-NO.1 (CONTROL-GRID) VOLTAGE:**

Negative bias value: 0 max volts

Positive bias value: 0 max volts

**PEAK HEATER-CATHODE VOLTAGE:**

Heater negative with respect to cathode: 90 max volts

Heater positive with respect to cathode: 90 max volts

**Characteristics:**

- Plate Supply Voltage: 100 volts, 250 volts
- Grid No.3 (Suppressor Grid): Connected to cathode at socket
- Grid No.2 Supply Voltage: 100 volts
- Cathode-Bias Resistor: 68 ohms, 68 ohms
- Plate Resistance (Approx.): 0.25, 1.0, 4400 µmhos
- Transconductance: 4500, 4400 µmhos
- Grid-No.1 Voltage (Approx.) for transconductance of 40 µmhos: -20 volts
- Plate Current: 10.8 ma, 11 ma
- Grid-No.2 Current: 4.4 ma, 4.2 ma

**INSTALLATION AND APPLICATION**

Type 6BA6 requires miniature seven-contact socket and may be mounted in any position. Outline 11, OUTLINES SECTION.

**Control-grid bias** variation will be found effective in changing the volume of the receiver. In order to obtain adequate volume control, an available grid-No.1 bias voltage of approximately 50 volts will be required. The exact value will depend upon the circuit design and operating conditions. This voltage may be obtained, depending on the receiver requirements, from a potentiometer across a fixed supply voltage, from a variable cathode-bias resistor, from the a.v.c. system, or from a combination of these methods.

The grid-No. 2 (screen-grid) voltage may be obtained from a potentiometer or bleeder circuit across the B-supply source, or through a dropping resistor from the...
plate supply. The use of series resistors for obtaining satisfactory control of grid-No.2 voltage in the case of four-electrode tubes is usually impossible because of secondary-emission phenomena. In the 6BA6, however, because grid No.3 practically removes these effects, it is practical to obtain grid-No.2 voltage through a series-dropping resistor from the plate supply or from some high intermediate voltage, provided the source does not exceed the plate-supply voltage. With this method, the grid-No.2-to-cathode voltage will fall off very little from minimum to maximum value of the resistor controlling cathode bias. In some cases, it may actually rise. This rise of grid-No.2-to-cathode voltage above the normal maximum value is allowable because both the grid-No.2 current and the plate current are reduced simultaneously by a sufficient amount to prevent damage to the tube. It should be recognized that, in general, the series-resistor method of obtaining grid-No.2 voltage from a higher voltage supply necessitates the use of the variable cathode-resistor method of controlling voltage in order to prevent too high a voltage on grid No.2. When grid-No.2 and control-grid voltage are obtained in this manner, the remote "cutoff" advantage of the 6BA6 can be fully realized. However, it should be noted that the use of a resistor in the grid-No.2 circuit will have an effect on the change in plate resistance with variation in grid-No.3 (suppressor-grid) voltage in case grid No.3 is utilized for control purposes.

Grid No. 3 (suppressor grid) may be connected directly to the cathode or it may be made negative with respect to the cathode. For the latter condition, the grid-No.3 voltage may be obtained from a potentiometer or bleeder circuit, or from the ave system.

AVERAGE PLATE CHARACTERISTICS

PENTAGRID CONVERTER

Miniature type used as converter in superheterodyne circuits especially those for the FM broadcast band. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

**PEAK HEATER-CATHODE VOLTAGE:**
- Heater negative with respect to cathode: 90 max volts
- Heater positive with respect to cathode: 90 max volts

**Characteristics (Separate Excitation):**
- Plate Voltage: 100 250 volts
- Grid No. 5 and Internal Shield*: Connected directly to ground
- Grid-No.2 and No.4 (Screen-Grid) Voltage: 100 100 volts
- Grid-No.3 (Control-Grid) Voltage: -1.0 -1.0 volt
- Grid-No.1 (Oscillator-Grid) Resistor: 20000 20000 ohms
- Plate Resistance (Approx.): 0.5 1.0 megohm
- Conversion Transconductance: 900 950 µmhos
- Conversion Transconductance (Approx.): 3.5 3.5 µmhos
- Plate Current: 3.6 3.8 ma
- Grid-No 2 and No.4 Current: 10.2 10 ma
- Grid-No.1 Current: 0.35 0.35 ma
- Total Cathode Current: 14.2 14.2 ma

**NOTE:** The transconductance between grid No.1 and grids No.2 and No.4 connected to plate (not oscillating) is approximately 8000 µmhos under the following conditions: signal applied to grid No.1 at zero bias; grids No.2 and No.4 and plate at 100 volts; grid No.3 grounded. Under the same conditions, the plate current is 32 milliampere, and the amplification factor is 16.5.

* The characteristics shown with separate excitation correspond very closely with those obtained in a self-excited oscillator circuit operating with zero bias.

**MEDIUM-MU TRIODE — SHARP-CUTOFF PENTODE**

Miniature type used in a wide variety of applications in color and black-and-white television receivers. This type has a controlled heater warm-up time for use in receivers employing series-connected heater strings. The pentode unit is used as a video amplifier, an age amplifier, or a reactance tube. The triode unit is used in low-frequency oscillator and phase-splitter circuits. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

**HEATER VOLTAGE (AC/DC):** 6.3 volts

**HEATER CURRENT:** 0.6 ampere

**HEATER WARM-UP TIME (Average):** 11 seconds

SHARP-CUTOFF BEAM TRIODE

6BD4
6BD4-A

Glass octal types used for the voltage regulation of high-voltage, low-current dc power supplies in color television receivers. Outline 47, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.6. Maximum ratings for voltage-control service: dc plate volts, 6BD4 20000 max, 6BD4-A 27000 max; unregulated dc supply volts, 6BD4 40000 max, 6BD4-A 55000 max; dc grid volts, -125 max; peak grid volts, -550 max; dc plate ma., 1.5 max; plate dissipation, 6BD4 20 max watts, 6BD4-A 25 max watts; peak heater-cathode volts, 180 max. These are DISCONTINUED types listed for reference only.

REMOTE-CUTOFF PENTODE

6BD6

Miniature type used as rf or if amplifier in radio receivers. This type is similar in performance to metal type 6SK7. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.3. Characteristics as class A amplifier: plate volts, 250 (500 max); grid No. 3 connected to cathode at socket; grid-No. 2 volts, 100 (125 max); grid-No. 1 volts, -3; plate resistance (approx.), 0.8 megohm; transconductance, 2000 µmhos; plate dissipation, 3 max watts; grid-No. 2 input, 0.65 max watt; plate ma., 9; grid-No. 2 ma., 3; total cathode ma., 14 max; peak heater-cathode volts, 90 max. This type is used principally for renewal purposes.

PENTAGRID CONVERTER

6BE6

Miniature type used as converter in superheterodyne circuits in both the standard broadcast and FM bands. The 6BE6 is similar in performance to metal type 6SA7. For general discussion of pentagrid types, see Frequency Conversion in ELECTRON TUBE APPLICATION SECTION.

Note: The transconductance between grid No.1 and grids No.2 and No.4 connected to plate (not oscillating) is approximately 7250 μmhos under the following conditions: grids No.1 and No.3 at 0 volts; grids No.2 and No.4 and plate at 100 volts. Under the same conditions, the plate current is 25 ma., and the amplification factor is 20.

*The characteristics shown with separate excitation correspond very closely with those obtained in a self-excited oscillator circuit operating with zero bias.

INSTALLATION AND APPLICATION

Type 6BE6 requires miniature seven-contact socket and may be mounted in any position. Outline 11, OUTLINES SECTION.

Because of the special structural arrangement of the 6BE6, a change in signal-grid voltage produces little change in cathode current. Consequently, an r.f. voltage on the signal grid produces little modulation of the electron current flowing in the cathode circuit. This feature is important because it is desirable that the impedance in the cathode circuit should produce little degeneration or regeneration of the signal-frequency input and intermediate-frequency output. Another important feature is that, because signal-grid voltage has very little effect on the space charge near the cathode, changes in vcc bias produce little change in oscillator transconductance and in the input capacitance of grid No.1. There is, therefore, little detuning of the oscillator by vcc bias.

A typical self-excited oscillator circuit employing the 6BE6 is given in the CIRCUIT SECTION.

In the 6BE6 operation characteristics curves with self-excitation, E<sub>c</sub> is the voltage across the oscillator-coil section between cathode and ground; E<sub>c</sub> is the oscillator voltage between cathode and grid.
**BEAM POWER TUBE**

**6BF5**

Miniature type used in audio output stage of television and radio receivers. Triode-connected, it is used as a vertical deflection amplifier in television receivers. Outline 13, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 1.2. Typical operation as class A1 amplifier; plate volts, 110 (550 max); grid No.2 volts, 0.110 (117 max); grid No.1 volts, 7.5; peak at grid No.1 volts, 7.5; plate dissipation, 5.5 max watts; grid No.2 input, 1.25 max watts; plate ma., 35 (zero-signal), 39 (maximum-signal); grid No.2 ma., 1 (zero-signal), 10.5 (maximum-signal); plate resistance (approx.), 12000 ohms; transconductance, 7500 &mu;mos; plate load resistance, 2500 ohms; total harmonic distortion, 10 per cent; maximum-signal power output, 1.9 watts; peak heater-cathode volts, 200 max (dc component 100 max when heater is positive with respect to cathode). This type is used principally for renewal purposes.

**TWIN DIODE—MEDIUM-MU TRIODE**

**6BF6**

Miniature type used in compact radio equipment as combined detector, amplifier, and aec tube. The triode unit is particularly useful as a driver for impedance- or transformer-coupled output stages in automobile receivers. It is equivalent in performance to metal type 6SR7. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. For typical operation as a resistance-coupled amplifier, refer to Chart 7, RESISTANCE-COUPLED AMPLIFIER SECTION.

![Graph showing the characteristics of the 6BF6 tube.](image-url)
**Technical Data**

**Peak Heater-Cathode Voltage:**
- Heater negative with respect to cathode: 90 max volts
- Heater positive with respect to cathode: 90 max volts

**Typical Operation (With Transformer Coupling):**
- Plate Voltage: 250 volts
- Grid Voltage: -9 volts
- Amplification Factor: 16
- Plate Resistance: 8500 ohms
- Transconductance: 1900 μmhos
- Plate Current: 9.5 ma
- Load Resistance: 10000 ohms
- Total Harmonic Distortion: 6.5 per cent
- Power Output: 300 mw

**Maximum Rating:**
- **DIODE UNITS**
  - **Plate Current (Each Unit):** 1.0 max ma

The two diode plates and the triode unit have a common cathode. Diode biasing of the triode unit of the 6BF6 is not suitable. For diode operation curves, refer to type 6AV6.

**Beam Power Tube**

Glass octal types used as output amplifier in horizontal-deflection circuits of television equipment and other applications where high pulse voltages occur during short duty cycles. Outlines 52 and 46, respectively, OUTLINES SECTION. Tubes require octal socket. Vertical tube mounting is preferred but horizontal operation is permissible if pins No.2 and 7 are in vertical plane.

- **#6BG6-G**
- **6BG6-GA**

**HORIZONTAL DEFLECTION AMPLIFIER**

RCA Receiving Tube Manual

Peak Cathode Current ........................................... 400 max ma
Average Cathode Current ............................................. 110 max ma
Plate Dissipation†† .................................................. 20 max watts
Grid-No.2 Input .................................................. 3.2 max watts
Peak Heater-Cathode Voltage ........................................
Heater negative with respect to cathode .................. 200 max volts
Heater positive with respect to cathode .................. 200 max volts
Bulb Temperature (At hottest point) .................. 210 max °C

Maximum Circuit Value:
Grid-No.1-Circuit Resistance .................................. 0.47 max megohm
* The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
† Preferably obtained through a series dropping resistor of sufficient magnitude to limit the grid-No.2 input to the rated maximum value.
†† An adequate bias resistor or other means is required to protect the tube in the absence of excitation.
* The dc component must not exceed 100 volts.

**TWIN DIODE—MEDIUM-MU TRIODE**

Miniature type used in a wide variety of applications in black-and-white and color television receivers. The diode units are used in phase-detector, phase-comparator, ratio-detector or discriminator, and horizontal a-fc discriminator circuits. The triode unit is used in phase-splitter, audio-frequency amplifier, and low-frequency oscillator applications; it may also be used as a vertical-deflection amplifier in compact portable television receivers. This type has a controlled heater warm-up time for use in
receivers employing series-connected heater strings. Each of the three units has its own cathode with individual base-pin terminal to provide flexibility of circuit connections. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

**BEAM POWER TUBE**

Miniature type used in audio output stages of television and radio receivers. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 1.3. Typical operation as class A amplifier: plate and grid-No.2 volts, 250 max; grid-No.1 volts, -5; peak af grid-No.1 volts, 5; plate dissipation, 9 max watts; grid-No.2 Input, 2.5 max watts; plate ma., 35 (zero-signal), 37 (maximum-signal); grid-No.2 ma., 3.5 (zero-signal), 10 (maximum-signal); plate resistance (approx.), 0.1 megohm; transconductance, 5500 µmhos; load resistance, 6500 ohms; total harmonic distortion, 7 per cent; power output, 3.5 watts; peak heater-cathode volts, 100 max. This type is used principally for renewal purposes.

**MEDIUM-MU TWIN TRIODE**

6BK7-A
6BK7-B

Miniature types used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners. In such circuits, one triode unit is used as the direct-coupled grounded-cathode driver for the other unit. These types are also used in push-pull cathode-drive rf amplifiers. Type 6BK7-B has a controlled heater warm-up time for use in receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Tubes require miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.45; warm-up time (average) for 6BK7-B, 11 seconds. Characteristics as class A amplifier (each unit): plate supply volts, 150 (300 max); grid volts, -50 max; cathode-bias resistor, 56 ohms; plate resistance (approx.), 4600 ohms; transconductance, 9300 µmhos; plate ma., 18; plate dissipation, 2.7 max watts; grid volts (approx.) for plate current of 10 µa, -11; peak heater-cathode volts, 90 max. Type 6BK7-A is a DISCONTINUED type listed for reference only.

**HALF-WAVE VACUUM RECTIFIER**

6BL4

Glass octal type used as a damper tube in horizontal deflection circuits of color television receivers. Outline 41, OUTLINES SECTION, except base is short jumbo-shell octal. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 3. Maximum ratings for damper service: peak inverse plate volts (absolute maximum): 4500 max; peak plate ma., 1200 max; dc plate ma., 200 max; plate dissipation, 8 max watts; peak heater-cathode volts, 4500 absolute max when heater is negative with respect to cathode (dc component must not exceed 900 volts); 300 max when heater is positive with respect to cathode (dc component must not exceed 100 volts). This is a DISCONTINUED type listed for reference only.

**MEDIUM-MU TWIN TRIODE**

6BL7-GT
6BL7-GTA

Glass octal types used as combined vertical deflection amplifier and vertical deflection oscillator in television receivers. When so operated, it is recommended that unit No.1 (pins 4, 5, and 6) be used as the oscillator. Outline 22, OUTLINES SECTION. Tubes
require octal socket and may be mounted in any position. Type 6BL7-GT is a DISCONTINUED type listed for reference only.

* The dc component must not exceed 100 volts.

MEDIUM-MU TRIODE—SHARP-CUTOFF PENTODE

6BR8
6BR8-A

Miniature types used in a wide variety of applications in color and black-and-white television receivers. Especially useful as combined triode oscillator and pentode mixer in vhf television tuners. Type 6BR8-A has a controlled heater warm-up time for use in receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Except for basing arrangement and grid-No.1-to-plate capacitance of pentode unit, these types are identical with miniature types 6U8 and 6U8-A, respectively.

MEDIUM-MU TWIN TRIODE

6BS8

Miniature type used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners. In such circuits, one triode unit is used as the direct-coupled grounded-cathode driver for the other unit. This type is also used in push-pull cathode-drive rf amplifiers. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

### Maximum Circuit Values:

- Grid-Circuit Resistance: 2.2 max 2.2 max megohms

The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.

* Under no circumstances should this absolute value be exceeded.

* The dc component must not exceed 100 volts.

### FULL-WAVE VACUUM RECTIFIER

Octal type having high pwrance used as a damper tube in horizontal deflection circuits of television receivers or as a rectifier in conventional power-supply applications. Outline 31, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. It is especially significant that this tube, like other power-handling tubes, be adequately ventilated. Heater volts (ac/dc), 6.3; amperes, 1.6. Maximum ratings for damper service (each unit): peak inverse plate volts, 3000 max; peak plate ma., 525 max; dc plate ma., 155 max. Peak heater-cathode volts: heater negative with respect to cathode, 450 max; heater positive with respect to cathode, 100 max. This type is used principally for renewal purposes.

6BY5-GA

### PENTAGRID AMPLIFIER

Miniature type used as a gated amplifier in color television receivers. In such service, it may be used as a combined sync separator and sync clipper. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

**AVERAGE PLATE CHARACTERISTICS**

**MEDIUM-MU TRIODE**

Metal type 6C5 and glass octal type 6C5-GT used as audio amplifier and oscillator. They are also used as detectors of grid-resistor-and-capacitor type or grid-bias type. Outlines 3
and 24, respectively, OUTLINES SECTION. Tubes require octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.3. Maximum ratings as class A₁ amplifier; plate volts, 300 max; plate dissipation, 2.5 max watts; grid volts, 0 min. Typical operation: plate volts, 250; grid volts, −8 (grid-circuit resistance should not exceed 1.0 megohm); amplification factor, 20; plate resistance, 10000 ohms; transconductance, 2000 μmhos; plate ma., 8. For typical operation as a resistance-coupled amplifier, refer to Chart 9, RESISTANCE-COUPLED AMPLIFIER SECTION. Type 6C5-GT is used principally for renewal purposes.

SHARP-CUTOFF PENTODE

Glass type used as biased detector and as a high-gain amplifier in radio equipment. Outline 45, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.5. For ratings and typical operation data, refer to type 6J7. Type 6C6 is used principally for renewal purposes.

TWIN DIODE—MEDIUM-MU TRIODE

Glass type used as combined detector, amplifier, and a-c tube. Outline 40, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.8. This type is similar to, but not interchangeable with, type 6S5. The 6C7 is a DISCONTINUED type listed for reference only.

MEDIUM-MU TWIN TRIODE

Glass octal type used as a voltage amplifier and phase inverter in radio equipment. Outline 39, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Maximum ratings for each triode unit as class A₁ amplifier: plate volts, 250 max; grid volts, 0 min; plate dissipation, 1.0 max watt. Typical operation: plate volts, 250; grid volts, −4.5; plate ma., 3.2; plate resistance, 22500 ohms; amplification factor, 36; transconductance, 1600 μmhos. This type is used principally for renewal purposes.

BEAM POWER TUBE

Glass octal types used as horizontal deflection amplifiers in color television receivers. Outlines 49 and 46, respectively, OUTLINES SECTION. Tubes require octal socket and may be mounted in any position. Type 6CB5 is a DISCONTINUED type listed for reference only.

| HEATER VOLTAGE (AC/DC) | 6.3 volts |

---

**SHARP-CUTOFF PENTODE**

6CF6

Miniature type used in television receivers as an intermediate-frequency amplifier at frequencies up to about 45 megacycles per second and as an rf amplifier in vhf television tuners. Because of its plate-current cutoff characteristic, this type is used in gain-controlled stages of video if amplifiers. This type is identical with miniature type 6CB6 except that the grid-No.1 voltage (approx.) for plate current of 35 microamperes is -6.5 volts. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.3.

---

**MEDIUM-MU TWIN TRIODE**

6CG7

Miniature type used as combined vertical deflection and horizontal deflection oscillator in television receivers. Also used as phase inverter, sync separator and amplifier, and resistance-coupled amplifier in radio receivers. This type has a controlled heater warm-up time for use in receivers employing series-connected heater strings. Except for the common heater, each triode unit is independent of the other. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. For typical operation as phase inverter or resistance-coupled amplifier, refer to Chart 10, RESISTANCE-COUPLED AMPLIFIER SECTION.

AVERAGE PLATE CHARACTERISTICS
FOR EACH UNIT

TRIODE-PENTODE CONVERTER

6CG8

6CG8-A

Miniature types used as combined oscillator and mixer tubes in television receivers utilizing an intermediate frequency in the order of 40 megacycles per second. When used in an AM/FM receiver, the triode unit is used as an oscillator for both sections. In the AM section, the pentode unit is used as a high-gain pentode mixer; in the FM section, the pentode unit is used either as a pentode mixer or as a triode-connected mixer depending on signal-to-noise considerations. Type 6CG8-A has a controlled heater warm-up time for use in television receivers employing series-connected heater strings. Outline 12, OUTLINES SECTION. Tubes require miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.45; warm-up time (average) for 6CG8-A, 11 seconds. Maximum ratings, characteristics, and typical operating values are the same as those of miniature type 6X8 except that maximum grid-No.2 input is 0.5 watt and maximum peak heater-cathode voltage is 200 volts. When the heater is positive with respect to the cathode, the dc component of the heater-cathode voltage should not exceed 100 volts. For curves of average characteristics, see type 6X8.

Medium-Mu Triode—Sharp-Cutoff Pentode

Miniature type used in a wide variety of applications in television receivers. The pentode unit is used as an if amplifier, video amplifier, agc amplifier, or reactance tube. The triode unit is used in low-frequency oscillator, sync-separator, sync-clipper, and phase-splitter circuits. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Pin No.5 must be connected to ground to maintain the grid No.3 at ground potential. Heater volts (ac/dc), 6.3; amperes, 0.45. The heater-cathode voltage of the pentode unit (heater negative with respect to cathode) should not exceed the value of the operating cathode bias. Peak heater-cathode volts with heater positive with respect to cathode, 0 max. Other maximum ratings and characteristics are the same as those of miniature type 6AN5. For curves of average plate characteristics, refer to type 6AN8.

**MEDIUM-MU TRIODE—SHARP-CUTOFF TETRODE**

Miniature type used in a wide variety of applications in color and black-and-white television receivers. This type has a controlled heater warm-up time for use in receivers employing series-connected heater strings. Especially useful as combined vhf oscillator and mixer in tuners of television receivers utilizing an intermediate frequency in the order of 40 megacycles per second. The tetrode unit is used as a mixer, video if amplifier, or sound if amplifier tube. The triode unit is used in vhf oscillator, phase-
splitter, sync-clipper, sync-separator, and rf amplifier circuits. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

Grid-No.1-Circuit Resistance:
For fixed-bias operation ............................................. 0.1 max megohm
For cathode-bias operation ........................................... 0.5 max megohm

**Average Characteristics**

**Medium-Mu Triode—Sharp-Cutoff Pentode**

6CU8

Miniature type used in a wide variety of applications in color and black-and-white television receivers. This type has a controlled heater warm-up time for use in receivers employing series-connected heater strings. The pentode unit is used as an if amplifier, a video amplifier, an age amplifier, and a reactance tube. The triode unit is used in low-frequency oscillator, sync-separator, sync-clipper, and phase-splitter circuits. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater warm-up time and interelectrode capacitances, this type is electrically identical with miniature type 6AN8. For curves of plate characteristics, refer to type 6AN8.

**Direct Interelectrode Capacitances:**

Triode Unit:
- Grid to Plate .................................................. 1.6 \( \mu F \)
- Grid to Cathode, Heater, Pentode Grid No.2, and Internal Shield ............................................. 1.9 \( \mu F \)
- Plate to Cathode, Heater, Pentode Grid No.2, and Internal Shield ............................................. 1.6 \( \mu F \)

Pentode Unit:
- Grid No.1 to Plate .................................................. 0.025 \( \mu F \)
- Grid No.1 to Cathode, Heater, Grid No.3, Triode Cathode, and Internal Shield ............................................. 0.7 \( \mu F \)
- Plate to Cathode, Heater, Grid No.2, Grid No.3, Triode Cathode, and Internal Shield ............................................. 2.4 \( \mu F \)
- Triode Grid to Pentode Plate ............................................. 0.065 \( \mu F \)
- Pentode Grid No.1 to Triode Plate ............................................. 0.02 \( \mu F \)
- Pentode Plate to Triode Plate ............................................. 0.04 \( \mu F \)

**Sharp-Cutoff Pentode**

6CY5

Miniature type used as rf amplifier in vhf tuners of television receivers. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.
Technical Data

Heater Voltage (AC/DC) .................. 6.3 volts
Heater Current .......................... 0.2 ampere
Direct Inter-electrode Capacitances (Approx.) *:
Grid-No.1 to Plate .......................... 0.03 uF
Grid-No.1 to Cathode, Heater, Grid-No.2, and Internal Shield ....... 4.5 uF
Plate to Cathode, Heater, Grid-No.2, and Internal Shield .......... 3 uF

* With external shield connected to cathode.

Plate Resistance (Approx.) ......................................... 73000 ohms
Transconductance ................................................... 4800 μmhos
Load Resistance ..................................................... 5000 ohms
Total Harmonic Distortion ......................................... 1.0 per cent
Maximum-Signal Power Output ..................................... 5.4 watts

Maximum Circuit Values:
Grid-No.1-Circuit Resistance:
For fixed-bias operation ........................................... 0.1 max megohm
For cathode-bias operation ........................................ 1.0 max megohm

PUSH-PULL CLASS AB1 AMPLIFIER

Maximum Ratings:
( Same as for single-tube Class A1 Amplifier)

Typical Operation (Values are for two tubes):
Plate Voltage ......................................................... 350 volts
Grid-No.2 Voltage ................................................... 280 volts
Grid-No.1 Voltage ................................................... -23.5 volts
Peak AF Grid-No.1-to-Grid-No.1 Voltage ......................... 47 volts
Zero-Signal Plate Current .......................................... 46 ma
Maximum-Signal Plate Current .................................... 103 ma
REMOTE-CUTOFF PENTODE

Glass type used in rf and if stages of radio receivers employing ac. Outline 45, OUTLINES SECTION. Tube requires six-contact socket. Except for interelectrode capacitances, this type is identical electrically with type 6U7-G. Refer to type 6SK7 for application information. Heater volts (ac/dc), 6.3; amperes, 0.3. This type is used principally for renewal purposes.

SHARP-CUTOFF PENTODE

Glass type used as detector or amplifier in radio receivers. Outline 45, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.3. For electrical characteristics, refer to type 6J7. Type 6D7 is a DISCONTINUED type listed for reference only.

PENTAGRID CONVERTER

Glass octal type used in superheterodyne circuits. Outline 39, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Except for interelectrode capacitances and heater rating, the 6D8-G is similar electrically to type 6A8-G. Type 6D8-G is a DISCONTINUED type listed for reference only.

SEMIREMOTE-CUTOFF PENTODE

Miniature type used in the gain-controlled picture if stages of color television receivers. It is also used as a radio-frequency amplifier in the tuners of such receivers. Outline 11, OUTLINES SECTION. Tube requires seven-contact miniature socket and may be mounted in any position.
HEATER VOLTAGE (AC/DC).......................... 6.3 volts
HEATER CURRENT.................................. 0.3 ampere
DIRECT INTERELECTRODE CAPACITANCES:
  Grid No.1 to Plate............................... 0.02 max μf
  Grid No.1 to Cathode, Heater, Grid No.2, Grid No.3, and Internal Shield
  Plate to Cathode, Heater, Grid No.2, Grid No.3, and Internal Shield.... 6.5 μf 2 μf

Maximum Ratings:

**CLASS A, AMPLIFIER**

PLATE VOLTAGE.................................... 300 max volts
GRID-No.3 (SUPPRESSOR-GRID) VOLTAGE........... 0 max volts
GRID-No.2 SUPPLY VOLTAGE....................... 300 max volts
GRID-No.2 (SCREEN-GRID) VOLTAGE................ See curve page 69
GRID-No.1 (CONTROL-GRID) VOLTAGE, Positive bias value........... 0 max volts
PLATE DISSIPATION................................ 2 max watts
GRID-No.2 INPUT:
  For grid-No.2 voltages up to 150 volts........ 0.5 max watt
  See curve page 69
  For grid-No.2 voltages between 150 and 300 volts........ 200 max volts
PEAK HEATER-CATHODE VOLTAGE:
  Heater negative with respect to cathode........ 200 max volts
  Heater positive with respect to cathode........ 200 max volts

Characteristics:

Plate Supply Voltage................................ 200 volts
Grid-No.3......................................... Connected to cathode at socket
Grid-No.2 Supply Voltage.......................... 150 volts
Cathode-Bias Resistor................................ 180 ohms
Plate Resistance (Approx.)........................ 0.5 megohm
Transconductance................................. 5500 μmhos
Grid-No.1 Voltage (Approx.) for transconductance of 50 μmhos... -12.5 volts
Plate Current..................................... 5 ma
Grid-No.2 Current.................................. 3 ma

Maximum Circuit Values (For maximum rated conditions):

Grid-No.1-Circuit Resistance:
  For fixed-bias operation........................ 0.25 max megohm
  For cathode-bias operation..................... 1.0 max megohm

* The dc component must not exceed 100 volts.

**SHARP-CUTOFF PENTODE**

6DE6

Miniature type used in the gain-controlled picture if stages of television receivers utilizing an intermediate frequency in the order of 40 megacycles per second. Also used as an rf amplifier in vhf television tuners. This tube features very high transconductance combined with low interelectrode capacitance values, and is provided with separate base pins for grid No.3 and cathode to permit the use of an unbypassed cathode resistor to minimize the effects of regeneration. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.
**Beam Power Tube**

Glass octal type used as output tube in audio-amplifier applications.

Outline 22, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position.

PLATE VOLTS

HIGH-MU TWIN TRIODE

6DT8

Miniature type used in a wide variety of applications in radio and television receivers. Especially useful in push-pull rf amplifiers or as frequency converter in FM tuners. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for heater rating, interelectrode capacitances, and baying arrangement, this type is identical with miniature type 12AT7.

* With external shield connected to cathode of unit under test.
† With external shield connected to grid of unit under test.

ELECTRON-RAY TUBE

6E5

Glass type used to indicate visually by means of a fluorescent target the effects of a change in a controlling voltage. It is used as a convenient means of indicating accurate radio-receiver tuning. Outline 34, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.3. For additional considerations, refer to Tuning Indication with Electron-Ray Tubes in ELECTRON TUBE APPLICATIONS SECTION.

* For zero triode-grid voltage.  † Subject to wide variations.

**TWIN POWER TRIODE**

Glass type used as class A1 amplifier in either push-pull or parallel circuits. Outline 43, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.6. With plate volts of 250 and grid volts of -27.5, characteristics for each unit are: plate ma., 18; plate resistance, 3560 ohms; transconductance, 1700 $\mu$hos; amplification factor, 6. With plate-to-plate load resistance of 14,000 ohms, output for two tubes is 1.6 watts. This is a DISCONTINUED type listed for reference only.

6E6

**REMOTE-CUTOFF PENTODE**

Glass type used in rf and if stages of radio receivers employing ave. Outline 45, OUTLINES SECTION. Except for interelectrode capacitances, this type is identical electrically with type 6U7-G. Heater volts (ac/dc), 6.3; amperes, 0.3. This is a DISCONTINUED type listed for reference only.

6E7

**POWER PENTODE**

Miniature type used in the audio output stage of radio and television receivers and in phonographs. This type has unusually high power sensitivity and is capable of providing relatively high power output at low plate and screen-grid voltages with a low af grid-No.1 driving voltage. Outline 13, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

† The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.
* Under no circumstances should this absolute value be exceeded.
□ The dc component must not exceed 100 volts.

AVERAGE CHARACTERISTICS
WITH $E_{C2}$ AS VARIABLE

HIGH-MU TRIODE

6F5 6F5-GT

Metal type 6F5 and glass octal type 6F5-GT used in resistance-coupled amplifier circuits. Outlines 4 and 21, respectively, OUTLINES SECTION. Tubes require octal socket and may be mounted in any position. Type 6F5-GT may be supplied with pin No.1 omitted. For typical operation as a resistance-coupled amplifier, refer to Chart 13, RESISTANCE-COUPLED AMPLIFIER SECTION. Heater volts (ac, dc), 6.3; amperes, 0.3. Typical operation as class A amplifier: plate volts, 250 (300 max); grid volts, -2; amplification factor, 100; plate resistance, 6600 ohms; transconductance, 1500 $\mu$hos; plate ma., 0.9. Type 6F5-GT is a DISCONTINUED type listed for reference only.

POWER PENTODE

6F6 6F6-G 6F6-GT

Metal type 6F6 and glass octal types 6F6-G and 6F6-GT used in the audio output stage of ac receivers. Tubes are capable of large power output with relatively small input voltage.

206
Outlines 6, 42 and 26, respectively, OUTLINES SECTION. Type 6F6-GT may be supplied with pin No.1 omitted. Tubes require octal socket and may be mounted in any position. It is especially important that these tubes, like other power-handling tubes, be adequately ventilated. Types 6F6-G and 6F6-GT are used principally for renewal purposes.

**HEATER VOLTAGE (AC/DC)** ................................................. 6.3 volts

### PUSH-PULL CLASS A1 AMPLIFIER

(Same as for single-tube class A1 amplifier)

### MEDIUM-MU TRIODE—REMOTE-CUTOFF PENTODE

Glass type adaptable to circuit design in several ways. Outline 40, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation as class A1 amplifier: pentode unit—plate volts, 250 max; grid-No.2 volts, 100; grid-No.1 volts, -3; plate resistance, 0.85 megohm; transconductance, 1100 µmhos; plate ma., 6.5; grid-No.2 ma., 1.5; triode unit—plate volts, 100 max; grid volts, -3; amplification factor, 8; plate resistance, 0.016 megohm; transconductance, 500 µmhos; plate ma., 3.5. This type is used principally for renewal purposes.
MEDIUM-MU TWIN TRIODE

Glass octal type used as voltage amplifier or phase inverter in radio equipment. Outline 39, OUTLINES SECTION. Tube requires octal socket. Except for the heater rating of 6.3 volts (ac/dc) and 0.6 ampere and interelectrode capacitances, each triode unit is identical electrically with type 6H6. For typical operation as a resistance-coupled amplifier, refer to Chart 10, RESISTANCE-COUPLED AMPLIFIER SECTION. Type 6F8-G is used principally for renewal purposes.

POWER PENTODE

Glass octal type used in output stage of radio receivers where moderate power output is required. Outline 36, OUTLINES SECTION. Tube requires octal socket. Except for interelectrode capacitances and a plate resistance of 175000 ohms, this type is electrically identical with type 6AK6. Heater volts (ac/dc), 6.3; amperes, 0.15. Type 6G6-G is used principally for renewal purposes.

TWIN DIODE

Metal type 6H6 and glass octal type 6H6-GT used as detectors, low-voltage rectifiers, and arc tubes. Except for the common heater, the two diode units are independent of each other. For diode detector considerations, refer to ELECTRON TUBE APPLICATIONS SECTION. Type 6H6-GT is a DISCONTINUED type listed for reference only.

INSTALLATION AND APPLICATION

Types 6H6 and 6H6-GT require an octal socket and may be mounted in any position. Type 6H6-GT may be supplied with pin No.1 omitted. Outlines 1 and 22 respectively, OUTLINES SECTION.

For detection, the diodes may be utilized in a full-wave circuit or in a half-wave circuit. In the latter case, one plate only, or the two plates in parallel, may be
Technical Data

employed. For the same signal voltage, the use of the half-wave arrangement will provide approximately twice the rectified voltage as compared with the full-wave arrangement.

For automatic volume control, the 6H6 and 6H6-GT may be used in circuits similar to those employed for any of the twin-diode types of tubes. The only difference is that the 6H6 and 6H6-GT are more adaptable because each diode has its own separate cathode.

MEDIUM-MU TRIODE

Metal type 6J5 and glass octal type 6J5-GT used as detectors, amplifiers, or oscillators in radio equipment. These types feature high transconductance together with comparatively high amplification factor. Outlines 3 and 24, respectively, OUTLINES SECTION. Tubes require octal socket and may be mounted in any position. For typical operation as resistance-coupled amplifiers, refer to Chart 10, RESISTANCE-COUPLED AMPLIFIER SECTION.

MEDIUM-MU TWIN TRIODE

6J6

Miniature type used as combined rf power amplifier and oscillator or as twin af amplifier. With push-pull arrangement of the grids and the plates in parallel, it is also used as a mixer at frequencies as high as 600 megacycles per second. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

Heater Voltage (AC/DC): 6.3 volts
Heater Current: 0.45 ampere
Direct Inter-electrode Capacitances (Each Unit, Approx.):
Grid to Plate: 1.6 μμf
Grid to Cathode and Heater: 2.2 μμf
Plate to Cathode and Heater: 0.4 μμf

Maximum Ratings:
CLASS A1 AMPLIFIER
PLATE VOLTAGE: 300 max volts
PLATE DISSIPATION (Per Unit): 1.5 max watts
PEAK HEATER-CATHODE VOLTAGE:
Heater negative with respect to cathode: 100 max volts
Heater positive with respect to cathode: 100 max volts

Characteristics (Each Unit):
Plate Voltage: 100 volts
Cathode-Bias Resistor: 50† ohms
Amplification Factor: 38
Plate Resistance: 7100 ohms
Transconductance: 6300 μμhos
Plate Current: 8.5 ma

Maximum Circuit Values (For maximum rated conditions):
Grid-Circuit Resistance:
For fixed-bias operation: Not recommended
For cathode-bias operation: 0.5 max megohm
† Value is for both units operating at the specified conditions.

RF POWER AMPLIFIER AND OSCILLATOR—Class C Telegraphy
Values are for both units, unless otherwise specified.

Maximum Ratings:
DC PLATE VOLTAGE: 300 max volts
DC GRID VOLTAGE: −40 max volts
DC PLATE CURRENT (Per Unit): 15 max ma
DC GRID CURRENT (Per Unit): 8 max ma
DC PLATE INPUT (Per Unit): 4.5 max watts
PLATE DISSIPATION (Per Unit): 1.5 max watts
PEAK HEATER-CATHODE VOLTAGE:
Heater negative with respect to cathode: 100 max volts
Heater positive with respect to cathode: 100 max volts

Typical Operation:†
DC Plate Voltage: 150 volts
DC Grid Voltage*: −10 volts
DC Plate Current: 30 ma
DC Grid Current (Approx.): 16 ma
Driving Power (Approx.): 0.35 watt
Power Output (Approx.): 3.5 watts
† At moderate frequencies in push-pull, key-down conditions without modulation. At 250 Mc, approximately 1.0 watt can be obtained when the 6J6 is used as a push-pull oscillator with a plate voltage of 150 volts, with maximum rated plate dissipation, and with a grid resistor of 2000 ohms common to both units.
* Obtained by grid resistor (625 ohms), cathode-bias resistor (220 ohms), or fixed supply.
SHARP-CUTOFF PENTODE

Metal type 6J7 and glass octal types 6J7-G and 6J7-GT are used as biased detectors or high gain audio amplifiers in radio receivers. Outlines 4,39, and 23, respectively, OUTLINES SECTION. Type 6J7-GT is used principally for renewal purposes. Type 6J7-G is a DISCONTINUED type listed for reference only. All types require octal socket and may be mounted in any position. For typical operation as resistance-coupled amplifiers, refer to Charts 9 and 11, RESISTANCE-COUPLED AMPLIFIER SECTION.

Transconductance ...................................... 1800 1900 \(\mu\)hos
Plate Current .......................................... 5.3 6.5 ma

Maximum Circuit Value:
Grid-No.1-Circuit Resistance .......................... 1.0 max megohm
* Greater than 1.0 megohm.
* Grids No.2 and No.3 connected to plate.

TRIODE—HEPTODE CONVERTER

Glass octal type used as a combined triode oscillator and heptode mixer in radio receivers. Outline 39, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation—Heptode unit: plate volts, 250 (300 max); grids-No.2 and-No.4 volts, 100 max; grid-No.1 volts, -3; plate resistance, 1.5 megohms; conversion transconductance, 290 \(\mu\)hms; plate ma., 1.4; grids-No.2 and-No.4 ma., 2.3. Triode unit: plate volts, 250 max (applied through 20000-ohm dropping resistor); grid resistor, 50000 ohms; plate ma., 5.0. This is a DISCONTINUED type listed for reference only.

HIGH-MU TRIODE

Glass octal type used as voltage amplifier in radio equipment. Outline 23, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Characteristics as class A1 amplifier: plate volts, 250 max; grid volts, -3; amplification factor, 70; plate resistance, 50000 ohms; transconductance, 1400 \(\mu\)hms; plate ma., 1.1. This is a DISCONTINUED type listed for reference only.

POWER PENTODE

Glass octal type used in output stage of radio receivers and, triode-connected, as a vertical deflection amplifier in television receivers. It is capable of delivering moderate power output with relatively small input voltage. Tube may be used singly or in push-pull. This type may be supplied with pin No.1 omitted. Tube requires octal socket and may be mounted in any position. Outline 22, OUTLINES SECTION. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

HEATER VOLTAGE (AC/DC) ............................ 6.3 volts
HEATER CURRENT ....................................... 0.4 ampere
DIRECT INTERELECTRODE CAPACITANCES (APPROX.)
Grid No.1 to Plate .................................... 0.5 \(\mu\)f
Grid to Plate, Heater, Grid No.2, and Grid No.3 ........................................ 5.5 \(\mu\)f
Plate to Cathode, Heater, Grid No.2, and Grid No.3 ........................................ 6.0 \(\mu\)f

Maximum Ratings:

CLASS A1 AMPLIFIER

Plate Voltage ......................................... 315 max volts
Grid-No.2 (Screen-Grid) Voltage .................. 235 max volts
Plate Dissipation ...................................... 8.5 max watts
Grid-No.2 Input ...................................... 2.8 max watts
Grid-No.1 (Control-Grid) Voltage, Positive bias value .................................. 0 max volts
Peak Heater-Cathode Voltage:
Heater negative with respect to cathode .......... 200 max volts
Heater positive with respect to cathode ......... 200* max volts
* The dc component must not exceed 100 volts.

Typical Operation:
Plate Voltage ......................................... 100 250 315 volts
Grid-No.2 Voltage ................................... 100 250 250 volts
Grid-No.1 Voltage .................................... -7 -18 -21 volts
Peak AF Grid-No.1 Voltage ......................... 7 18 21 volts
Zero-Signal Plate Current ........................................ 9 32 25.5 ma
Maximum-Signal Plate Current .................................. 9.5 33 28 ma
Zero-Signal Grid-No.2 Current .................................. 1.6 5.5 4.0 ma
Maximum-Signal Grid-No.2 Current ............................ 3 10 9 ma
Plate Resistance (Approx.) ...................................... 104000 90000 110000 ohms
Transconductance .................................................. 1500 2300 2100 μhos
Load Resistance .................................................... 12000 7600 9000 ohms
Total Harmonic Distortion ........................................ 11 11 15 per cent
Maximum-Signal Power Output .................................... 0.36 3.4 4.5 watts

Typical Push-Pull Operation (Values are for two tubes):
Plate Supply Voltage .............................................. 285 285 volts
Grid-No.2 Supply Voltage .......................................... 285 285 volts
Grid-No.1 Voltage .................................................. -25.5 volts
Cathode-Bias Resistor ............................................ -400 ohms
Peak AF Grid-No.1-to-Grid-No.1 Voltage ....................... 51 51 ma
Zero-Signal Plate Current ......................................... 55 55 ma
Maximum-Signal Plate Current ................................... 72 61 ma
Zero-Signal Grid-No.2 Current ................................... 9 9 ma
Maximum-Signal Grid-No.2 Current ............................. 17 13 ma
Effective Load Resistance (Plate-to-plate) .................... 12000 12000 ohms
Total Harmonic Distortion ....................................... 6 4 per cent
Maximum-Signal Power Output ................................... 10.5 9.8 watts

Maximum Circuit Values:
Grid-No.1-Circuit Resistance:
For fixed-bias operation ........................................... 0.1 max megohm
For cathode-bias operation ....................................... 0.5 max megohm

Characteristics (Triode Connection)*:
Plate Voltage ....................................................... 250 volts
Grid-No.1 Voltage .................................................. -18 volts
Plate Current ....................................................... 37.5 ma
Transconductance .................................................. 2700 μhos
Amplification Factor ............................................... 6.8
Plate Resistance (Approx.) ........................................ 2500 ohms
Grid Voltage (Approx.) for plate current of 0.5 ma ........... -48 volts

* Grid-No.2 connected to plate.

VERTICAL DEFLECTION AMPLIFIER (Triode Connection)*

Maximum Ratings: For operation in a 525-line, 30-frame system
DC Plate Voltage .................................................... 315 max volts
Peak Positive-Pulse Plate Voltage (Absolute maximum) ....... 12000 max volts
Peak Negative-Pulse Grid-No.1 Voltage .......................... -250 max volts
Peak Cathode Current ............................................... 75 max ma
Average Cathode Current .......................................... 25 max ma
Plate Dissipation .................................................. 7 max watts
Peak Heater-Cathode Voltage:
Heater negative with respect to cathode ....................... 200 max volts
Heater positive with respect to cathode ....................... 200 max volts

Maximum Circuit Value:
Grid-No.1-Circuit Resistance:
For cathode-bias operation ...................................... 2.2 max megohms

* Grid-No.2 connected to plate.
† The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.
* Under no circumstances should this absolute value be exceeded.
* The dc component must not exceed 100 volts.

AVERAGE PLATE CHARACTERISTICS

TYPE 6K6-GT
E = 6.3 VOLTS
GRID-MAX VOLTS = 250

![Graph Image]
REMOTE-CUTOFF PENTODE

Metal type 6K7 and glass octal types 6K7-G and 6K7-GT used in rf and if stages of radio receivers, particularly in those employing ave. Outlines 4, 39, and 23, respectively, OUTLINES SECTION. These tubes require octal socket and may be mounted in any position. For electrode voltage supplies and application, refer to type 68K7. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation as cathode mixer: plate volts to 250 (500 max); grid No.3 connected to cathode at socket; grid-No.2 supply volts, 300 max; grid-No.2 volt, 125; grid-No.1 volts, -3; plate resistance, 0.6 megohm; transconductance, 1650 µmhos; plate ma, 10.5; grid-No.2 ma, 2.6; plate dissipation, 2.75 max watts; grid-No.2 input, 0.35 max watts. Types 6K7 and 6K7-GT are used principally for renewal purposes. Types 6K7-G is a DISCONTINUED type listed for reference only.

TRIODE-HEXODE CONVERTER

Metal type 6K8 and glass octal types 6K8-G and 6K8-GT used as combined triode oscillator and hexode mixer in radio receivers. Type 6K8, Outline 5, type 6K8-G, Outline 39, OUTLINES SECTION. Types 6K8-G and 6K8-GT are DISCONTINUED types listed for reference only. Tubes require octal socket and may be mounted in any position. For application, refer to Frequency Conversion in ELECTRON TUBE APPLICATIONS SECTION.

Heater Voltage (ac/dc) .................................................. 6.3 volts
Heater Current .......................................................... 0.3 ampere

Maximum Ratings: CONVERTER SERVICE

Hexode Plate Voltage .................................................. 300 max volts
Hexode Grid-No.2-And-No.4 (Screen-Grid) Voltage ............... 150 max volts
Hexode Grid-No.2-And-No.4 Supply Voltage ..................... 300 max volts
Hexode Grid-No.3 (Control-Gate) Voltage, Positive Bias Voltage 0 max volts
Triode Plate Voltage ................................................... 125 max volts
Hexode Plate Dissipation ............................................. 0.75 max watt
Hexode Grid-No.2-And-No.4 Input .................................. 9.7 max watt
Triode Plate Dissipation ............................................. 0.76 max watt
Total Cathode Current .................................................. 15 ma
Peak Heater-Cathode Voltage:
Heater negative with respect to cathode 90 max volts
Heater positive with respect to cathode 90 max volts

Typical Operation:
Hexode Plate Voltage .................................................. 100 volt
Hexode Grid-No.2-And-No.4 Voltage ................................ 100 volt
Hexode Grid-No.3 Voltage ............................................. 3 volt
Triode Plate Voltage ................................................... 100 volt
Triode Grid Resistor ................................................... 50000 ohms
Hexode Plate Resistance (Approx.) 0.4 50000 ohms
Conversion Transconductance ........................................ 325 megohm
Hexode Grid-No.3 Voltage (Approx.) for conversion transconductance of 2 µmhos 0.4 -30 30 volts
Hexode Plate Current ................................................... 2.3 2.5 ma
Hexode Grids-No.2-And-No.4 Current 6.2 6.0 ma
Triode Plate Current ................................................... 3.8 3.8 ma
Triode Grid and Hexode Grid-No.1 Current 0.15 0.5 ma
Total Grid Current ..................................................... 12.5 12.5 ma

The transconductance of the triode section, not oscillating, of the 6K8 is approximately 3000 µmhos when the triode plate voltage is 100 volts, and the triode grid voltage is 0 volts.

MEDIUM-MU TRIODE

Glass octal type used as detector, amplifier, or oscillator in radio receivers. Outline 36, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.15. Typical operation and characteristics: plate volts, 250 max; grid volts, -3; plate ma, 8; plate resistance, 9000 ohms; amplification factor, 17; transconductance, 1900 µmhos; grid voltage for cathode-current cutoff, -20. This is a DISCONTINUED type listed for reference only.

6L5-G
# Technical Data

## BEAM POWER TUBE

Metal type 6L6 and glass octal types 6L6-G and 6L6-GB are used in the output stage of radio receivers and amplifiers, especially those designed to have ample reserve of power-delivering ability. These types provide high power output, sensitivity, and high efficiency. Power output at all levels has low third and negligible higher-order harmonics. Type 6L6-G is a DISCONTINUED type listed for reference only.

### Specifications

**HEATER VOLTAGE (ac/dc)**
- 6L6: 6.3 volts
- 6L6-G: 6.3 volts
- 6L6-GB: 6.3 volts

**HEATER CURRENT**
- 6L6: 0.3 ampere
- 6L6-G: 0.3 ampere
- 6L6-GB: 0.3 ampere

**DIRECT INTERELECTRODE CAPACITANCES (Approx.)**
- Grid No.1 to Plate: 0.4 μf
- Grid No.1 to Cathode, Heater, Grid No.2, and Grid No.3: 10 μf
- Plate to Cathode, Heater, Grid No.2, and Grid No.3: 12 μf

* Pin No.1 connected to pin No.8.

### SINGLE-TUBE CLASS A₁ AMPLIFIER

#### Maximum Ratings:
- **PLATE VOLTAGE:** 360 max volts
- **GRID-NO.2 (SCREEN-GRID) VOLTAGE:** 270 max volts
- **PLATE DISSIPATION:** 19 max watts
- **GRID-NO.2 INPUT:** 2.5 max watts
- **PEAK HEATER-CATHODE VOLTAGE:**
  - Heater negative with respect to cathode: 180 max volts
  - Heater positive with respect to cathode: 180 max volts

**INSTALLATION AND APPLICATION**

Types 6L6, 6L6-G, and 6L6-GB require an octal socket and may be mounted in any position. Outlines 7, 50, and 38, respectively, OUTLINES SECTION. It is especially important that these tubes, like other power-handling tubes, be adequately ventilated.

As **class A\textsubscript{1} power amplifiers**, the 6L6 and 6L6-GB may be operated as shown in the tabulated data. The values cover cathode- and fixed-bias operation for both types where used as beam power tubes as well as where they are connected as triodes and have been determined on the basis that no grid current flows during any part of the input-signal swing. The second harmonics can easily be eliminated by the use of push-pull circuits. In single-tube amplifiers with resistance-coupled input, the second harmonics can be minimized by generating out-of-phase second harmonics in the pre-amplifier.

As **push-pull class AB\textsubscript{1} power amplifiers**, the 6L6 and 6L6-GB may be operated as shown in the tabulated data. The values shown cover cathode- and fixed-bias operation and have been determined on the basis that no grid current flows during any part of the input-signal swing.

As **push-pull class AB\textsubscript{2} power amplifiers**, the 6L6 and the 6L6-GB may be operated as shown in the tabulated data. The values cover operation with fixed bias and have been determined on the basis that some grid current flows during the most positive swing of the input signal.

216
Refer to CIRCUIT SECTION for circuits employing the 6L6 or 6L6-GB, and to the ELECTRON TUBE APPLICATIONS SECTION for discussion of inverse-feedback arrangements.

**PENTAGRID MIXER**

Metal type 6L7 and glass octal type 6L7-G are used as mixers in superheterodyne circuits having a separate oscillator stage as well as in other applications where dual control is desirable in a single stage. The two separate control grids are shielded from each other and the coupling effects between oscillator and signal circuits are very small. For additional information, refer to *Frequency Conversion*, ELECTRON TUBE APPLICATIONS SECTION. Outlines 4 and 39, respectively, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation as mixer (values recommended for all-wave receivers): plate volts, 250 (300 max); grids-No.2-and-No.4 volts, 150 max; grid-No.1 volts, −6 min; grid-No.3 volts, −15; peak oscillator volts applied to grid No.3, 18 min; plate dissipation, 1 max watt; grids-No.2-and-No.4 input, 1.5 max watts; plate ma, 3.3; grids-No.2-and-No.4 ma, 9.2; plate resistance, greater than 1 megohm; conversion transconductance, 350 μmhos. Type 6L7-G is a DISCONTINUED type listed for reference only.

**DIRECT-COUPLED POWER TRIODE**

Glass octal type used as class A1 power amplifier. Outline 42, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.8. For electrical characteristics, refer to type 6B5. Type 6N6-G is a DISCONTINUED type listed for reference only.

**HIGH-MU TWIN POWER TRIODE**

Metal type 6N7 and glass octal type 6N7-GT used in output stage of radio receivers as class B power amplifier or with units in parallel as a class A1 amplifier to drive a 6N7 or 6N7-GT.
as a class B amplifier. Outlines 6 and 22, respectively, OUTLINES SECTION. Tubes require octal socket and may be mounted in any position. For typical operation as a resistance-coupled amplifier, refer to Chart 1, RESISTANCE-COUPLED AMPLIFIER SECTION. For class B amplifier considerations, refer to ELECTRON TUBE APPLICATIONS SECTION. Type 6N7 is used principally for renewal purposes.

Heater Voltage (ac/dc) .......................................................... 6.3 volts

| Plate Load—depends largely on the design factors of the class B amplifier. In general, the load will be between 20,000 and 40,000 ohms. Power Output—Under maximum voltage conditions, upwards of 400 milliwatts can be obtained.

**MEDIUM-MU TRIODE**

Glass octal type used as detector, amplifier, or oscillator in radio receivers. Outline 22, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for interelectrode capacitances, this type is identical electrically with type 76. Type 6P5-GT is a DISCONTINUED type listed for reference only.

**6P5-GT**

**TRIODE—PENTODE**

Glass octal type used as an amplifier. Outline 39, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for interelectrode capacitances, this type is identical electrically with type 6P7. Type 6P7-G is a DISCONTINUED type listed for reference only.

**6P7-G**
TWIN DIODE—HIGH-MU TRIODE

Metal type 6Q7 and glass octal types 6Q7-G and 6Q7-GT used as combined detector, amplifier, and a/c tubes in radio receivers. Outlines 4, 39, and 23, respectively, OUTLINES SECTION. Types 6Q7 and 6Q7-GT are used principally for renewal purposes. Type 6Q7-G is a DISCONTINUED type listed for reference only. Tubes require octal socket. Heater voltage (ac/dc), 6.3 volts, 0.3. These types are similar electrically in most respects to types 6SS7 and 6AT6. Maximum ratings and typical operation of the triode unit as a class A1 amplifier are the same as those for type 6AT6 except that with a plate voltage of 100 volts, the transconductance is 1200 μmhos and the plate resistance 58000 ohms. The triode unit is recommended for use only in resistance-coupled circuits; refer to Chart 5, RESISTANCE-COUPLED AMPLIFIER SECTION. For triode-unit, grid-bias considerations and diode curves, refer to type 6AV6.

TWIN DIODE—MEDIUM-MU TRIODE

Metal type 6R7 and glass octal types 6R7-G and 6R7-GT used as combined detector, amplifier, and a/c tubes. Outlines 4, 39, and 21, respectively, OUTLINES SECTION. Tubes require octal socket. Within their maximum ratings, these types are identical electrically with type 6B6E except for capacitances. Maximum ratings of triode unit as class A1 amplifier: plate voltage, 250 volts; plate dissipation, 2.5 watts. For typical operation as a resistance-coupled amplifier, refer to Chart 7, RESISTANCE-COUPLED AMPLIFIER SECTION. Types 6R7-G and 6R7-GT are DISCONTINUED types listed for reference only. Type 6R7 is used principally for renewal purposes.

MEDIUM-MU TRIODE

Miniature types having high permeance used as vertical deflection amplifiers in television receivers. Type 6S4-A has a controlled heater warm-up time for use in television receivers employing series-connected heater strings. Outline 14, OUTLINES SECTION. Tubes require miniature nine-contact socket and may be mounted in any position. Type 6S4 is a DISCONTINUED type listed for reference only.

VERTICAL DEFLECTION AMPLIFIER

For operation in a 533-line, 30-frame system

Maximum Ratings (Design—Maximum Values):

| DC PLATE VOLTAGE       | 550 max volts |
| PEAK POSITIVE-PULSE PLATE VOLTAGE† (Absolute maximum) | 2200 volts |
| PEAK NEGATIVE-PULSE GRID VOLTAGE | -250 max volts |
| PEAK CATHODE CURRENT   | 105 ma       |
| AVERAGE CATHODE CURRENT | 30 ma        |

219
RCA Receiving Tube Manual

**PLATE DISSIPATION**

8.5 max watts

**PEAK HEATER-CATHODE VOLTAGE:**

Heater negative with respect to cathode, 200 max volts

Heater positive with respect to cathode, 200 max volts

**Maximum Circuit Values:**

Grid-Circuit Resistance:

For cathode-bias operation, 2.2 max megohms

† The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.

* Under no circumstances should this absolute value be exceeded.

‡ The dc component must not exceed 100 volts.

---

**REMOTE-CUTOFF PENTODE**

Metal type 6S7 and glass octal type 6S7-G used in c1 and if stages of automobile receivers employing a-c. Outlines 5 and 38, respectively, OUTLINES SECTION. Type 6S7 is used principally for renewal purposes. Type 6S7-G is a DISCONTINUED type listed for reference only. Tubes require octal socket. Heater volts, 6.3; amperes, 0.15. Typical operation as Class A1 amplifier: plate volts, 250 (300 max); grid-No.2 volts, see curve page 69; grid-No.2 supply volts, 300 max; grid-No.1 volts, -3 (0 min); grid No.3 connected to cathode at socket; plate ma., 8.5; grid-No.2 ma., 2; plate resistance, 1.0 megohm; transconductance, 1750 μmhos; plate dissipation, 225 max watts; grid-No.2 input for grid-No.2 voltages up to 150 volts, 0.25 max watt; for grid-No.2 voltages between 150 and 300 volts, see curve page 69.

---

**TRIPLE DIODE—HIGH-MU TRIODE**

Glass octal type used as audio amplifier, AM detector, and FM detector in AM/FM receivers. Diode unit No.3 is used for AM detection, and diode units No.1 and No.3 are used for FM detection. Outline 21, OUTLINES SECTION, except over-all length is 3-9/16 max inches and seated height is 3 max inches. Tube requires octal socket. For typical operation as a resistance-coupled amplifier, refer to Chart 3, RESISTANCE-COUPLED AMPLIFIER.

SECTION. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation of triode unit as class A1 amplifier: plate volts, 250 (300 max); grid volts, -2; amplification factor, 100; plate resistance, 91000 ohms; transconductance, 1100 μmhos; plate dissipation, 0.5 max watt; plate ma, 0.9; peak heater-cathode volts, 90 max. Maximum plate ma. for diode units, 1.0 max (each unit). For diode operation curves, refer to type 6AV6. Type 6S8-GT is used principally for renewal purposes.

---

220
PENTAGRID CONVERTER

Metal type 6SA7 and glass octal type 6SA7-GT used as converters in superheterodyne circuits. They are similar in performance to type 6BE6. For general discussion of pentagrid types, see Frequency Conversion in ELECTRON TUBE APPLICATIONS SECTION. Both tubes have excellent frequency stability. Type 6SA7-GT is used principally for renewal purposes.

NOTE: The transconductance between grid No.1 and grids No.2 and No.4 connected to plate (not oscillating) is approximately 4500 µmhos under the following conditions: grids No.1, No.3, and shell at 0 volts; grids No.2 and No.4 and plate at 10 volts.

† Characteristics are approximate only and are shown for a Hartley circuit with a feedback of approximately 2 volts peak in the cathode circuit.

INSTALLATION AND APPLICATION

Types 6SA7 and 6SA7-GT require octal socket and may be mounted in any position. Outlines 3 and 22, respectively, OUTLINES SECTION.

Because of the special structural arrangement of the 6SA7 and 6SA7-GT, a change in signal-grid voltage produces little change in cathode current. Conse-
quently, an rf voltage on the signal grid produces little modulation of the electron current flowing in the cathode circuit. This feature is important because it is desirable that the impedance in the cathode circuit should produce little degeneration or regeneration of the signal-frequency input and intermediate-frequency output. Another important feature is that, because signal-grid voltage has little effect on the space charge near the cathode, changes in a-c bias produce little change in oscillator transconductance and in the input capacitance of the No.1 grid. There is, therefore, little detuning of the oscillator by a-c bias.

A typical self-excited oscillator circuit for use with the 6SA7 will be similar to that for the 6BE6 in the CIRCUIT SECTION. For operation in frequency bands lower than approximately 6 megacycles per second, the circuit should generally be adjusted to provide, with recommended values of plate and grids-No.2-and-No.4 voltage, a cathode voltage of approximately 2 volts peak, and a grid-No.1 current of 0.5 milliamperere through a grid resistor of 20000 ohms. In the low- and medium-frequency bands, the recommended oscillator conditions can be readily met. However, in the band covering frequencies higher than approximately 6 megacycles per second, the tank-circuit impedance is generally so low that it is not easy to obtain these oscillator conditions. For optimum performance in this band, it is generally best to adjust the oscillator circuit for maximum conversion gain at the low-frequency end of the band. Maximum conversion gain at this end of the band is usually obtained by adjustment of the oscillator circuit to give a cathode voltage of approximately 2 volts peak and a grid-No.1 current of 0.20 to 0.25 milliamperere, with a grid resistor of 20000 ohms.

In the 6SA7 and 6SA7-GT operation characteristics curves with self-excitation, \( E_b \) is the voltage across the oscillator-coil section between cathode and ground; \( E_c \) is the oscillator voltage between cathode and grid.

**PENTAGRID CONVERTER**

Metal type used as converter in superheterodyne circuits. Because of its high conversion and oscillator transconductance. It is especially useful in FM converter service in the 100-megacycle region. The 6SB7-Y has a micanol base which minimizes drift in oscillator frequency during warm-up period. For general discussion of pentagrid types, see Frequency Conversion in ELECTRON TUBE APPLICATIONS SECTION. Outline 3, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.3. For maximum ratings and characteristics in converter service, refer to type 6BA7. Type 6SB7-Y is used principally for renewal purposes.
**HIGH-MU TWIN TRIODE**

Metal type used as phase inverter in radio equipment. Each unit may also be used in voltage amplifier circuits. Except for common cathode, each triode is independent of the other. Outline 3, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. For typical operation as a resistance-coupled amplifier, refer to Chart 12, RESISTANCE-COUPLED AMPLIFIER SECTION.

**HIGH-MU TRIODE**

Metal type 6SF5 and glass octal type 6SF5-GT are used in resistance-coupled amplifier circuits. Outlines 3 and 22, respectively, OUTLINES SECTION. Type 6SF5-GT may be supplied with pin No.1 omitted. Tubes require octal socket and may be mounted in any position. Characteristics, application, and references under type 6F5 apply.
to types 6SF5 and 6SF5-GT. Heater volts (ac de), 6.3; amperes, 0.3. Type 6SF5-GT is used principally for renewal purposes.

**DIODE—REMOTE-CUTOFF PENTODE**

Metal type used as combined rf or if amplifier and detector or ave tube in radio receivers. Also used as resistance-coupled amplifier. Outline 3, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Heater volts (ac/de), 6.3; amperes, 0.3. Maximum ratings of pentode unit as class A1 amplifier: plate and grid-No.2 supply volts, 300 max; grid-No.2 volts, 100 max; grid-No.1 volts, 0 max; plate dissipation, 3.5 max watts; grid-No.2 input, 0.5 max watt; peak heater-cathode volts, 90 max. For diode operation curves, refer to type 6AV6. Type 6SF7 is used principally for renewal purposes.

#### INSTALLATION AND APPLICATION

Types 6SJ7 and 6SJ7-GT require octal socket and may be mounted in any position. Outlines 3 and 24, respectively, OUTLINES SECTION.

As a class A amplifier, the 6SJ7 or 6SJ7-GT may be operated either as a pentode or as a triode, as shown under tabulated data. The grid-No.2 voltage for the 6SJ7 operated as a pentode may be obtained from a potentiometer or bleeder circuit across the B-supply device. Due to the grid-No.2-current characteristics of the 6SJ7, a resistor in series with the high-voltage supply may be employed for obtaining the grid-No.2 voltage, provided the cathode-resistor method of bias control is used. This method, however, is not recommended if the high-voltage B-supply exceeds 300 volts.

As a radio-frequency amplifier, the 6SJ7 or 6SJ7-GT may be used particularly in applications where the rf signal applied to grid No.1 is relatively low, that is, of the order of a few volts. In such cases either grid-No.2 or grid-No.1 voltage...
(or both) may be varied to control the receiver volume. When larger signals are involved, a remote-cutoff amplifier tube should be employed to prevent the occurrence of excessive cross-modulation and modulation-distortion.

As an audio-frequency amplifier in resistance-coupled circuits, the 6SJ7 or 6SJ7-GT may be operated under conditions shown in Chart 14, RESISTANCE-COUPLED AMPLIFIER SECTION.

**REMOTE-CUTOFF PENTODE**

Metal type 6SK7 and glass octal type 6SK7-GT are used as rf or if amplifiers in radio receivers. They feature single-ended construction and interlead shields. Because of remote-cutoff characteristic, these types are able to handle large signal voltages without cross-modulation or modulation-distortion and are often used in receivers with avc. Type 6SK7-GT is used principally for renewal purposes.

227
INSTALLATION AND APPLICATION

Types 6SK7 and 6SK7-GT require octal socket and may be mounted in any position. Outlines 3 and 24, respectively, OUTLINES SECTION.

Control-grid bias variation will be found effective in changing the volume of the receiver. In order to obtain adequate volume control, an available grid-bias voltage of approximately 50 volts will be required. The exact value will depend upon the circuit design and operating conditions. This voltage may be obtained, depending on the receiver requirements, from a potentiometer across a fixed supply voltage, from a variable cathode-bias resistor, from the aec system, or from a combination of these methods.

The grid-No.2 (screen-grid) voltage may be obtained from a potentiometer or bleeder circuit across the B-supply source, or through a dropping resistor from the plate supply. The use of series resistors for obtaining satisfactory control of grid-No.2 voltage in the case of four-electrode tubes is usually impossible because of secondary-emission phenomena. In the 6SK7, however, because grid No.3 practically removes these effects, it is possible to obtain grid-No.2 voltage through a series-dropping resistor from the plate supply or from some high intermediate voltage, provided the source does not exceed the plate-supply voltage. With this method, the grid-No.2-to-cathode voltage will fall off very little from minimum to maximum value of the resistor controlling cathode bias. In some cases, it may actually rise. This rise of grid-No.2-to-cathode voltage above the normal maximum value is allowable because both the grid-No.2 current and the plate current are reduced simultaneously by a sufficient amount to prevent damage to the tube. It should be recognized that, in general, the series-resistor method of obtaining grid-No.2 voltage from a higher voltage supply necessitates the use of the variable cathode-resistor method of controlling volume in order to prevent too high a voltage on grid No.2. When grid-No.2 and control-grid voltage are obtained in this manner, the remote "cutoff" advantage of the 6SK7 and 6SK7-GT can be fully realized. However, it should be noted that the use of a resistor in the grid-No.2 circuit will have an effect on the change in plate resistance with variation in grid-No.3 ( suppressor-grid) voltage in case grid No.3 is utilized for control purposes.

Grid No.3 (suppressor grid) may be connected directly to the cathode or it may be made negative with respect to the cathode. For the latter condition, the grid-No.3 voltage may be obtained from a potentiometer or bleeder circuit, or from the aec system.

HIGH-MU TWIN TRIODE

6SL7-GT

Glass octal type used as phase inverter in radio equipment. Each unit may also be used in resistance-coupled amplifier circuits. Outline 22, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Except for the common heater, each triode unit is independent of the other. For typical operation as phase inverter or resistance-coupled amplifier, refer to Chart 7, RESISTANCE-COUPLED AMPLIFIER SECTION.

230
Maximum Circuit Value:
Grid-Circuit Resistance: For cathode-bias operation 2.2 max megohms
- The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.
- Under no circumstances should this absolute value be exceeded.
- The dc component must not exceed 100 volts.

TWIN DIODE—HIGH-MU TRIODE
Metal type 6SQ7 and glass octal type 6SQ7-GT used as combined detector, amplifier, and avc tube in radio receivers. Outlines 3 and 24, respectively, OUTLINES SECTION. Tubes require octal socket and may be mounted in any position. These types are similar electrically to type 6Q7 in many respects, but they have a higher-mu triode. The triode unit is recommended for use only in resistance-coupled circuits; refer to Chart 3, RESISTANCE-COUPLED AMPLIFIER SECTION. Diode-biasing of the triode unit is not suitable because of the probability of triode plate-current cutoff even with relatively small signal voltages applied to the diode circuit. Type 6SQ7-GT is used principally for renewal purposes.

AVERAGE PLATE CHARACTERISTICS

ELECTRON-RAY TUBE
Glass type used to indicate visually, by means of a fluorescent target, the effects of a change in a controlling voltage. It is used as a convenient, non-mechanical means of indicating accurate radio-receiver tuning. Outline 34, OUTLINES SECTION. Tube requires six-contact socket and may be mounted in any position. For a discussion of electron-ray tube considerations, refer to ELECTRON TUBE APPLICATIONS SECTION. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation in indicator service: plate- and target-supply volts, 250 (285 max); series triode-plate resistor, 1 megohm; target ma., 4; triode plate ma., 0.24; plate dissipation, 1 max watt; triode grid volts (approx.), -22 for 0° shadow angle, 0 for 90° shadow angle; peak heater-cathode volts, 90 max. This type is used principally for renewal purposes.

REMOTE-CUTOFF PENTODE
Glass octal type used in rf and if stages of radio receivers employing acv. It is also used as a mixer in superheterodyne circuits. Maximum over-all length, 4-7/8 inches; maximum diameter, 1-9/16 inches. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.5. Typical operation as class A1 amplifier: plate volts, 250 (300 max); grid-No.2 supply volts, 300 max; grid-No.2 volts, 100; grid No.3 connected to cathode at socket; grid-No.1 volts, -9; plate resistance (approx.), 0.8 megohm; transconductance, 1600 μmhos; plate ma., 8.2; grid-No.2 ma., 2; plate dissipation, 2.25 max watts; grid-No.2 input, 0.25 max watt. This is a DISCONTINUED type listed for reference only.

TRIODE—PENTODE CONVERTER
Miniature types used as combined oscillator and mixer tubes in television receivers utilizing an intermediate frequency in the order of 40 megacycles per second. In such service, these types

234
give performance comparable to that obtainable with a 6AG5 mixer and an
oscillator consisting of one unit of a type 6J6. When used in an AM/FM receiver,
the triode unit is used as an oscillator for both sections. In the AM section, the
pentode unit is used as a high-gain pentode mixer; in the FM section, the pentode
unit is used either as a pentode mixer or as a triode-connected mixer depending on
signal-to-noise consideration. Type 6U8-A has a controlled heater warm-up time
for use in television receivers employing series-connected heater strings. Outline 12,
OUTLINES SECTION. Tubes require miniature nine-contact socket and may be
mounted in any position. Type 6U8 is a DISCONTINUED type listed for
reference only.

**HALF-WAVE VACUUM RECTIFIER**

Miniature type used as a damper tube in horizontal deflection circuits of television receivers. Outline 19, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

**HEATER VOLTAGE (AC/DC)** ............................................. 6.3 volts
**HEATER CURRENT** .................................................. 1.75 amperes

**DAMPER SERVICE**

*Maximum Ratings:*

- **PEAK INVERSE PLATE VOLTAGE** (Absolute Maximum) ............................................. 6000 volts
- **DC PLATE CURRENT** .............................. 800 ma
- **PEAK HEATER-CATHODE VOLTAGE:**
  - Heater negative with respect to cathode (Absolute Maximum) ......................... 6750 volts
  - Heater positive with respect to cathode ........................................ 300 volts

*Note: The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
* Under no circumstances should this absolute value be exceeded.
* The dc component must not exceed 750 volts.
* The dc component must not exceed 100 volts.

**BEAM POWER TUBE**

Metal type 6V6 and glass octal type 6V6-GT are used as output amplifiers in automobile, battery-operated, and other receivers in which reduced plate-current drain is desirable. Outlines 6 and 22, respectively, OUTLINES SECTION. Type 6V6-GT may be supplied with pin No.1 omitted. Tubes require octal socket and may be mounted in any position. The 6V6 and 6V6-GT are equivalent in performance to type 6AQ5. Refer to type 6AQ5 for average plate characteristic curves.

**HEATER VOLTAGE (AC/DC)** ............................................. 6.3 volts
**HEATER CURRENT** .................................................. 0.45 amperes

**DIRECT INTERELECTRODE CAPACITANCES (APPROX.):**

- Grid No.1 to Plate ........................................ 6V6 6V6-GT
- Grid No.1 to Cathode, Heater, Grid No.2, and Grid No.3 ................................ 0.3 0.7 μf
- Plate to Cathode, Heater, Grid No.2, and Grid No.3 ......................................... 10 9.0 μf

*With shell connected to cathode.*

  - For fixed-bias operation ........................................... $0.1\,\text{max} \,\text{megohm}$
  - For cathode-bias operation ...................................... $0.5\,\text{max} \,\text{megohm}$

Characteristics (Triode Connection)*:

- Plate Voltage .......................................................... 225 volts
- Grid-No.1 Voltage ...................................................... $-30\,\text{volts}$
- Amplification Factor .................................................. 6.2
- Plate Resistance ...................................................... 1600 $\text{ohms}$
- Transconductance ..................................................... 3800 $\mu\text{ohms}$
- Plate Current .......................................................... $22\,\text{ma}$
- Grid No.1 Voltage (Approx.) for plate current of 50 $\mu\text{a}$ .................. $-42\,\text{volts}$

*Grid No. 2 connected to plate.

VERTICAL DEFLECTION AMPLIFIER (Triode Connection)*

Maximum Ratings: For operation in a 525-line, 30-frame system

- DC Plate Voltage ...................................................... $300\,\text{max} \,\text{volts}$
- Peak Positive-Pulse Plate Voltage† (Absolute maximum) .................. $1200\,\text{max} \,\text{volts}$
- Peak Negative-Pulse Grid-No.1 Voltage ................................ $-250\,\text{max} \,\text{volts}$
- Peak Cathode Current ................................................ $140\,\text{ma}$
- Average Cathode Current ........................................... $40\,\text{ma}$
- Plate Dissipation ..................................................... $7.8\,\text{max} \,\text{watts}$
PEAK HEATER-CATHODE VOLTAGE:
Heater negative with respect to cathode ........................................ 200 max volts
Heater positive with respect to cathode ........................................ 200 max volts

Maximum Circuit Value:
Grid-No.1-Circuit Resistance:
For cathode-bias operation ......................................................... 2.2 max megohms
* Grid No.2 connected to plate.
† The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.
‡ Under no circumstances should this absolute value be exceeded.
§ The dc component must not exceed 100 volts.

SHARP-CUTOFF PENTODE
6W7-G
Glass octal type used as biased detector or high-gain amplifier in radio receivers. Outline 39, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Maximum ratings: plate volts, 300 max; grid-No.2 (screen-grid) volts, 100 max; grid-No.2 supply volts, 300 max; grid-No.1 (control-grid) volts, 0 min; plate dissipation, 0.5 max watt; grid-No.2 input, 0.1 max watt. Within its maximum ratings, this type is identical electrically with type 6J7. Type 6W7-G is a DISCONTINUED type listed for reference only.

FULL-WAVE VACUUM RECTIFIER
6X4
Miniature type used in power supply of automobile and ac-operated radio receivers. Equivalent in performance to larger types 6X5 and 6X5-GT. Type 6X4 requires miniature seven-contact socket and may be mounted in any position. Outline 13, OUTLINES SECTION. It is especially important that this tube, like other power-handling tubes, be adequately ventilated. For discussion of Rating Chart and Operation Characteristics, refer to INTERPRETATION OF TUBE DATA.

</table>

- If hot-switching is regularly required in operation, the use of choke-input circuits is recommended. Such circuits limit the hot-switching current to a value no higher than that of the peak plate current. When capacitor-input circuits are used, a maximum peak current value per plate of 1 ampere during the initial cycles of the hot-switching transient should not be exceeded.

- The dc component must not exceed 100 volts.

- Higher values of capacitance than indicated may be used, but the effective plate-supply impedance should be increased to prevent exceeding the maximum rating for peak plate current.

### FULL-WAVE VACUUM RECTIFIER

Metal type 6X5 and glass octal type 6X5-GT are used in power supply of automobile and ac-operated receivers. Outlines 6 and 22, respectively, OUTLINES SECTION. Type 6X5-GT may be supplied with pin No.1 omitted. Both types require octal socket. Type 6X5 should be mounted in vertical position, but horizontal operation is permissible if pins 3 and 5 are in horizontal plane. Type 6X5-GT may be operated in any position. For maximum ratings, typical operation data, and curves, refer to type 6X4. Type 6X5 is a DISCONTINUED type listed for reference only.

241
TRIODE-PENTODE CONVERTER

Miniature type used as combined oscillator and mixer tube in television receivers utilizing an intermediate frequency in the order of 40 megacycles per second. In such service, the 6X8 gives performance comparable to that obtainable with a 6AG5 mixer and an oscillator consisting of one unit of a type 6J6. When used in an AM FM receiver, the triode unit is used as an oscillator for both sections. In the AM section, the pentode unit is used as a high-gain pentode mixer; in the FM section, the pentode unit is used either as a pentode mixer or as a triode-connected mixer depending on signal-to-noise considerations. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

Type 6X8, $E_F = 6.3$ volts.
PLATE DISSIPATION
GRID-NO.2 INPUT:
For grid-No.2 voltages up to 125 volts. 1.5 max watts
For grid-No.2 voltages between 125 and 250 volts 0.5 max watts
GRID-NO.1 INPUT:
PEAK Heater-Cathode Voltage:
Heater negative with respect to cathode. 100 max volts
Heater positive with respect to cathode. 100 max volts

Typical Operation:
Plate Voltage 150 volts
Grid No.3 2.6 ms
Grid-No.1 Voltage 2700 μhos
Mixer Grid-No.1 Supply Voltage 6.2 ma
Oscillator Voltage at Mixer Grid No.1 120000 ohms
Mixer Grid-No.1-Circuit Resistance 2100 ohms
Oscillator Grid Resistor 1.8 ma
Conversion Transconductance 2.0 μa
Plate Current 13 ma
Grid-No.2 Current 0.5†
Grid-No.1 Current —
Oscillator Power Output (Approx.) 0.1 max megohm

Maximum Circuit Values:
Grid-No.1-Circuit Resistance: 0.5 max megohm
For fixed-bias operation
For cathode-bias operation

*With separate excitation and triode unit grounded.
†In TV or FM receivers, it is generally desirable to operate the oscillator with less power input than shown in the tabulated data in order to avoid over-excitation and excessive oscillator radiation.

AVERAGE PLATE CHARACTERISTICS
PENTODE UNIT

FULL-WAVE VACUUM RECTIFIER
Glass type used in power supply of radio receivers. Outline34 or35, OUTLINES SECTION. Heater volts (ac/dc), 6.3; amperes, 0.8. The maximum ac plate voltage per plate is 350 volts (rms), and the dc output current is 50 ma. This is a DISCONTINUED type listed for reference only.

BEAM POWER TUBE
Glass octal type used as output amplifier in radio receivers. Also used in rf-operated, high-voltage power supplies in television equipment. Outline 42, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 1.25. Typical operation as class A1 amplifier: plate volts, 185 (200 max); grid-No.2 volts, 135 max; grid-No.1 volts, -13.5; plate dissipation.
12.5 max watts; grid-No.2 input, 1.75 max watts; plate ma., 58; grid-No.2 ma., 3.5; plate resistance, 9300 ohms; transconductance, 7000 µmhos; load resistance, 2000 ohms; maximum-signal power output, 3.6. Typical operation as class C rf power amplifier and oscillator: dc plate volts, 350 max; dc grid-No.2 volts, 115 (135 max); dc grid-No.1 volts, -40 (90 max); peak rf grid-No.1 volts, 48; dc plate ma., 60 (80 max); dc grid-No.2 ma., 5.1; dc grid-No.1 ma., 1.4 (1.5 max); plate input, 28 max watts; grid-No.2 input, 0.6 max watt; plate dissipation, 8 max watts; driving power, 0.1 watt; power output (approx.), 14 watts. This type is used principally for renewal purposes.

**HIGH-MU TWIN POWER TRIODE**

**6Y7-G**

Glass octal type used as class B amplifier in output stage of radio receivers. Outline 36, OUTLINES SECTION. For electrical characteristics, refer to type 79. Heater volts (ac/dc), 6.3; amperes, 0.6. This is a DISCONTINUED type listed for reference only.

**FULL-WAVE VACUUM RECTIFIER**

**6Z5**

Glass type used in power supply of radio receivers. Outline 35, OUTLINES SECTION. Heater volts (ac/dc), 12.6 in series heater arrangement and 6.3 in parallel arrangement; amperes, 0.4 (series), 0.8 (parallel). Maximum ac plate voltage per plate is 220 volts, and maximum dc output current is 60 ma. This is a DISCONTINUED type listed for reference only.

**HIGH-MU TWIN POWER TRIODE**

**6Z7-G**

Glass octal type used as class B amplifier in output stage of radio receivers. Outline 36, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation and maximum ratings as class B power amplifier: plate volts, 180 max; grid volts, 0; peak plate ma. per plate, 60 max; average plate dissipation, 8 max watts; zero-signal plate ma. per plate, 4.2; plate-to-plate load resistance, 12000 ohms; output watts, 4.2 with average input of 320 milliwatts applied between grids. This is a DISCONTINUED type listed for reference only.

**FULL-WAVE VACUUM RECTIFIER**

**6ZY5-G**

Glass octal type used in power supply of radio equipment where economy of power is important. Outline 36, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.3. Maximum ratings: peak inverse plate volts, 1250; peak plate ma. per plate, 120; dc output ma., 40; peak heater-cathode volts, 450. This is a DISCONTINUED type listed for reference only.

**MEDIUM-MU TRIODE**

**7A4**

Glass lock-in type used as detector, amplifier, or oscillator in radio equipment. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Maximum ratings, typical operating conditions, and curves for type 7A4 are the same as for metal type 6J5. Type 7A4 is used principally for renewal purposes.

**BEAM POWER TUBE**

**7A5**

Glass lock-in type used as output amplifier in radio receivers in which the plate voltage available for the output stage is relatively low. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.75. Typical operation and maximum ratings as class A1 amplifier: plate volts, 110 (125 max); grid-No.2 volts, 110 (125 max); plate dissipation, 5.5 max watts; grid-No.2 input, 1.2 max watts; grid-No.1 volts, 7.5; plate ma., 40; grid-No.2 ma., 3; plate resistance, 16000 ohms; transconductance, 5800 µmhos; load resistance, 2500 ohms; maximum-signal output watts, 1.5. Type 7A5 is used principally for renewal purposes.
**TWIN DIODE**

Glass lock-in type used as detector, low-voltage rectifier, or avc tube. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Maximum ratings as rectifier: ac plate volts per plate (rms), 150; dc output ma. per plate, 8; peak ma. per plate, 45; peak heater-cathode volts, 330. The application of this type is similar to that of metal type 6H6. Type 7A6 is used principally for renewal purposes.

**REMOTE-CUTOFF PENTODE**

Glass lock-in type used as rf or if amplifier in radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. For maximum ratings, typical operation, and curves, refer to metal type 6SK7. Type 7A7 is used principally for renewal purposes.

**OCTODE CONVERTER**

Glass lock-in type used as converter in superheterodyne circuits. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Typical operation and maximum ratings as frequency converter: plate volts, 250 (300 max); grids-No.3-and-No.5 volts, 100 max; grid-No.2 supply volts, 250 (300 max); grid-No.2 volts. 165 (200 max); plate dissipation, 1 max watt; grids-No.3-and-No.5 input, 0.3 max watt; grid-No.2 input, 0.75 max watt; grid-No.4 volts, -3 (0 min); grid-No.1 resistor, 50000 ohms; plate ma., 3; grids-No.3-and-No.5 ma., 3.2; grid-No.2 ma., 4.2; grid-No.1 ma., 0.4; plate resistance, 0.7 megohm; conversion transconductance, 550 microhms. Type 7A8 is used principally for renewal purposes.

**POWER PENTODE**

Lock-in type used in output stage of video amplifier of television receivers. Outline 29, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.6. Typical operation and ratings as class A video amplifier: plate volts, 300 max; grid-No.2 volts, 150 max; plate dissipation, 10 max watts; grid-No.2 input, 1.2 max watts; cathode resistor, 68 ohms; plate ma., 28; grid-No.2 ma., 7; plate resistance, 300000 ohms; transconductance, 9500 microhms. This type is used principally for renewal purposes.

**MEDIUM-MU TWIN TRIODE**

Glass lock-in type used as voltage amplifier or phase inverter in radio equipment. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Ratings and characteristics as class A amplifier (each section): plate volts, 250 (300 max); cathode-bias resistor, 1100 ohms; plate ma., 9; transconductance, 2100 microhms; amplification factor, 16; plate resistance, 7600 ohms. This type is used principally for renewal purposes.

**SHARP-CUTOFF PENTODE**

Glass lock-in type used as rf amplifier in ac/dc receivers or in mobile equipment where low heater current drain is important. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Characteristics as class A amplifier: plate and grid-No.2 supply volts, 250 (300 max); plate dissipation, 2 max watts; grid-No.2 input, 0.75 max watt; grid No.3 and internal shield connected to cathode at socket; plate resistance (approx.), 0.75 megohm; transconductance, 4200 microhms; cathode-bias resistor, 250 ohms; plate ma., 6; grid-No.2 ma., 2. Type 7AG7 is used principally for renewal purposes.
REMOTE-CUTOFF PENTODE

Glass lock-in type used as rf amplifier in high-frequency and wide-band applications. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Characteristics as class A: amplifier; plate and grid-No.2 supply volts, 250 (300 max); plate dissipation, 2 max watts; grid-No.2 input, 0.7 max watt; cathode-bias resistor, 250 ohms; grid No.3 and internal shield connected to cathode at socket; plate resistance (approx.), 1 megohm; transconductance, 3300 μmhos; plate ma., 6.8; grid-No.2 ma., 1.9. Type 7AH7 is used principally for renewal purposes.

MEDIUM-MU TWIN TRIODE

Miniature type used as combined vertical deflection amplifier and vertical deflection oscillator in television receivers. This type has a controlled heater warm-up time for use in receivers employing series-connected heater strings. Each unit may also be used as a horizontal deflection oscillator, or in audio mixer, phase inverter, multivibrator, sync separator and amplifier, and resistance-coupled amplifier circuits in radio equipment. Outline 12, OUTLINES SECTION. Heater volts (ac/dc), 7 in series arrangement, 3.5 in parallel arrangement; amperes, 0.3 (series), 0.6 (parallel); warm-up time (average) in parallel arrangement, 11 seconds. Except for heater rating, this type is identical with miniature type 12AU7.

HIGH-MU TRIODE

Glass lock-in type used in resistance-coupled amplifier circuits. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for interelectrode capacitances, this type has the same maximum ratings and characteristics as metal types 6F5 and 6SF5. Type 7B4 is used principally for renewal purposes.

POWER PENTODE

Glass lock-in type used in output stage of radio receivers. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.4. Except for interelectrode capacitances, this type is the same electrically as glass-octal type 6K6-GT. Type 7B5 is used principally for renewal purposes.

TWIN DIODE—HIGH-MU TRIODE

Glass lock-in type used as combined detector, amplifier, and a-c tube. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for interelectrode capacitances, this type is the same electrically as metal type 6S(QT). Type 7B6 is used principally for renewal purposes.

REMOTE-CUTOFF PENTODE

Glass lock-in type used as rf or if amplifier in radio receivers employing a.c. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Typical operation as class A: amplifier; plate volts, 250 (300 max); grid-No.2 volts, 100; grid-No.1 volts, -3; grid No.3 connected to cathode at socket; plate ma., 8.5; grid-No.2 ma., 1.7; plate resistance, 675 megohm; transconductance, 1750 μmhos. Type 7B7 is used principally for renewal purposes.
PENTAGRID CONVERTER
Glass lock-in type used as frequency converter in superheterodyne circuits. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for interelectrode capacitances, this type is the same electrically as metal type 6A8. Type 7B8 is used principally for renewal purposes.

BEAM POWER TUBE
Glass lock-in type used as output amplifier in radio receivers. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.45. Refer to metal type 6V6 for maximum ratings and typical operation as single-tube class A1 amplifier and as push-pull amplifier, and for curves, to miniature type 6AQ5. Type 7C5 is used principally for renewal purposes.

TWIN DIODE—HIGH-MU TRIODE
Glass lock-in type used as combined detector, amplifier, and avc tube. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Typical operation of triode unit as class A1 amplifier: plate volts, 250 (300 max); grid volts, -1; plate ma., 1.3; plate resistance, 0.1 megohm; transconductance, 1000 μmhos. For diode operation curves and triode application, refer to miniature type 6AV6. Type 7C6 is used principally for renewal purposes.

SHARP-CUTOFF PENTODE
Glass lock-in type used as biased detector or rf amplifier. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.15. Typical operation as class A1 amplifier: plate volts, 250 (300 max); grid-No.2 volts, 100; grid-No.1 volts, -3 (0 min); grid-No.3 and internal shield connected to cathode at socket; plate resistance (approx.), 2 megohms; plate ma., 2; grid-No.2 ma., 0.5; transconductance, 1300 μmhos. Type 7C7 is used principally for renewal purposes.

TWIN DIODE—MEDIUM-MU TRIODE
Glass lock-in type used as combined detector, amplifier, and avc tube. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. For maximum ratings, typical operation, and curves, refer to miniature type 6B6. Type 7E6 is a DISCONTINUED type listed for reference only.

TWIN DIODE—REMOTE-CUTOFF PENTODE
Glass lock-in type used as combined detector, amplifier, and avc tube. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation of pentode unit as class A1 amplifier: plate volts, 250 (300 max); grid-No.2 volts, 100 max; plate dissipation, 2 max watts; grid-No.2 input, 0.3 max watt; cathode-bias resistor, 330 ohms; plate resistance, 0.7 megohm; transconductance, 1900 μmhos; plate ma., 7.5; grid-No.2 ma., 1.6. For diode curves, refer to type 6AV6. Type 7E7 is used principally for renewal purposes.

247
HIGH-MU TWIN TRIODE

Glass lock-in type used as phase inverter or resistance-coupled amplifier. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. For maximum ratings, typical operation as class A amplifier, and curves, refer to glass-octal type 6SL7-GT. Type 7F7 is used principally for renewal purposes.

MEDIUM-MU TWIN TRIODE

Glass lock-in type used as amplifier or oscillator in radio equipment. Outline 15, OUTLINES SECTION, except over-all length is 2-9/32 in. inches and seated length is 1-3/4 inches. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation as class A Amplifier (per unit): plate volts, 250 (300 max); cathode-bias resistor, 500 ohms; plate ma., 6.0; transconductance, 3500 μhos; amplification factor, 48. Type 7F8 is used principally for renewal purposes.

SHARP-CUTOFF PENTODE

Glass lock-in type used in video amplifiers of television receivers and in other applications requiring high transconductance. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.45. Typical operation as class A amplifier: plate volts, 250 (300 max); grid-No.2 volts, 100; plate dissipation, 1.6 max watts; grid-No.2 input, 0.3 max watt; grid-No.1 volts, -2; grid No.3 and internal shield connected to cathode at socket; plate resistance (approx.), 0.8 megohm; transconductance, 4500 μhos; plate ma., 6; grid-No.2 ma., 2.0. Type 7G7 is used principally for renewal purposes.

REMOTE-CUTOFF PENTODE

Glass lock-in type used as rf or if amplifier in radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation as class A amplifier: plate volts, 250 (300 max); grid-No.2 volts, 150; plate dissipation, 2.5 max watts; grid-No.2 input, 0.5 max watt; grid-No.3 and internal shield connected to cathode at socket; cathode-bias resistor, 180 ohms; plate resistance (approx.), 0.8 megohm; transconductance, 4000 μhos; plate ma., 10; grid-No.2 ma., 3.2. Type 7H7 is used principally for renewal purposes.

TRIODE—HEPTODE CONVERTER

Glass lock-in type used as combined oscillator and heptode mixer in radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. For maximum ratings and typical operation, refer to glass-octal type 6J7-GT. Type 7J7 is used principally for renewal purposes.

TWIN DIODE—HIGH-MU TRIODE

Glass lock-in type used as fm detector and audio amplifier in circuits which require diode and triode units with separate cathodes. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. For ratings and typical operation, refer to glass-octal type 6AQ7-GT. Type 7K7 is used principally for renewal purposes.
SHARP-CUTOFF PENTODE

Glass lock-in type used as rf and if amplifier in radio equipment. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation as class A; amplifier: plate volts, 250 (300 max); grid-No.2 volts, 100; grid-No.1 volts, -1.5; grid-No.3 tied to cathode at socket; cathode-bias resistor, 250 ohms; plate ma., 4.5; grid-No.2 ma., 1.5; plate resistance (approx.), 1 megohm; transconductance, 3100 µhos. This is a DISCONTINUED type listed for reference only.

MEDIUM-MU TWIN TRIODE

Glass lock-in type used as voltage amplifier or phase inverter in radio equipment. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.5. For maximum ratings and typical operation of each triode unit, refer to metal type 6JS. The application of this type is similar to that of glass-ocular type 6SN7-GT. Type 7N7 is used principally for renewal purposes.

PENTAGRID CONVERTER

Glass lock-in type used as converter in superheterodyne circuits. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. For maximum ratings, typical operation in converter service, and curves, refer to metal type 6SA7. Type 7Q7 is used principally for renewal purposes.

TWIN DIODE—REMOTE-CUTOFF PENTODE

Glass lock-in type used as combined detector, amplifier, and ave tube. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation of pentode unit as class A; amplifier: plate volts, 250 max; grid-No.2 volts, 100; plate dissipation, 2 max watts; grid-No.2 input, 0.25 max watt; grid-No.1 volts, -1 (0 min); plate resistance (approx.), 1.0 megohm; transconductance, 3200 µhos; plate ma., 5.7; grid-No.2 ma., 2.1. Refer to type 6A6/V6 for diode curves. Type 7R7 is used principally for renewal purposes.

TRIODE—HEPTODE CONVERTER

Glass lock-in type used as combined triode oscillator and heptode mixer in radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Typical operation of heptode unit: plate volts, 250 (300 max); grids-No.2 and-No.4 volts, 100; grid-No.1 volts, -2; plate resistance, 1.25 megohms; conversion transconductance, 525 µhos; plate ma., 1.8; grids-No.2 and-No.4 ma., 3.0. Typical operation of triode unit: plate supply volts, 250 (300 max) applied through a 20000-ohm dropping resistor bypassed by a 0.1-µf capacitor; grid resistor, 50000 ohms; plate ma., 5.0; total cathode ma. (both units), 10.2. This is a DISCONTINUED type listed for reference only.

SHARP-CUTOFF PENTODE

Glass lock-in type used as rf or if amplifier in radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.45. Typical operation as class A; amplifier: plate and grid-No.2 supply volts, 300 max; grid-No.2 series resistor, 40000 ohms; plate dissipation, 4 max watts; grid-No.2 input, 0.8 max watt; grid No.3 connected to cathode at socket; cathode-bias resistor, 160 ohms; plate resistance, 0.3 meghohm; transconductance, 5800 µhos; plate ma., 10; grid-No.2 ma., 3.9. Type 7V7 is used principally for renewal purposes.
SHARP-CUTOFF PENTODE
Glass lock-in type used as rf or if amplifier in radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.45. This type is the same as type 7V7 except for socket connections. Type 7W7 is used principally for renewal purposes.

7W7

TWIN DIODE—HIGH-MU TRIODE
Glass lock-in type used as combined detector, amplifier, and avc tube in circuits which require diodes with separate cathodes. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Ratings and characteristics of triode unit as class A: amplifier: plate volts, 250 (300 max); grid volts, -1; amplification factor, 100; plate resistance, 6700 ohms; transconductance, 1500 umhos; plate ma., 1.9. Type 7X7 is used principally for renewal purposes.

7X7

FULL-WAVE VACUUM RECTIFIER
Glass lock-in type used in power supply of automobile radio receivers and compact ac-operated receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.5. Maximum ratings: peak inverse plate volts, 1250; peak plate ma. per plate, 180; dc output ma., 70; peak heater-cathode volts, 450. For typical operation, refer to miniature type 6X4. Type 7Y4 is used principally for renewal purposes.

7Y4

FULL-WAVE VACUUM RECTIFIER
Glass lock-in type used in power supply of automobile and ac-operated radio receivers. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 6.3; amperes, 0.9. Maximum ratings: peak inverse plate volts, 1250; peak plate ma. per plate, 300; dc output ma., 100; peak heater-cathode volts, 450. Typical operation with capacitor-input filter: ac plate-to-plate supply voltage (rms), 650; total effective plate-supply impedance per plate, 75 min ohms; dc output ma., 100. Typical operation with choke-input filter: ac plate-to-plate supply voltage (rms), 900; filter-input choke, 6 min henries; dc output ma., 100. This type is used principally for renewal purposes.

7Z4

HIGH-MU TRIODE—SHARP-CUTOFF PENTODE
Miniature type used in a wide variety of applications in television receivers employing series-connected heater strings. The pentode unit is used as an amplifier and the triode unit is used in low-frequency oscillator or sync circuits. Outline 14, OUTLINES SECTION. Heater volts (ac/dc), 8.4; amperes, 0.45; warm-up time (average) 11 seconds. Except for heater rating, this type is identical with miniature type 6AW8-A.

8AW8-A

MEDIUM-MU TWIN TRIODE
Miniature type used as combined vertical deflection and horizontal deflection oscillator in television receivers employing series-connected heater strings. Outline 14, OUTLINES SECTION. Heater volts (ac/dc), 8.4; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6CG7.

8CG7
**MEDIUM-MU DUAL TRIODE**

Miniature type used as combined vertical oscillator and vertical deflection amplifier in television receivers employing series-connected heater strings. Outline 14, OUTLINES SECTION. Heater volts (ac/dc), 8.4; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6CM7.

**BEAM POWER TUBE**

Miniature type used as vertical deflection amplifier in television receivers utilizing picture tubes having diagonal deflection angles of 110 degrees and employing series-connected heater strings. Outline 18, OUTLINES SECTION. Heater volts (ac/dc), 8.4; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with miniature type 6EM5.

**POWER TRIODE**

Glass type used as an audio-frequency amplifier. Outline 51, OUTLINES SECTION. Tube requires four-contact socket. Filament volts (ac/dc), 7.5; amperes, 1.25. Typical operation as class A1 af power amplifier: plate volts, 425 max; grid volts, -40; peak af grid volts, 35; plate ma., 18; plate resistance, 5000 ohms; transconductance, 1600 μhos; load resistance, 10200 ohms; undistorted output watts, 1.6. This is a DISCONTINUED type listed for reference only.

**DUAL TRIODE**

Miniature type used as combined vertical oscillator and vertical deflection amplifier in television receivers employing series-connected heater strings. Unit No.1 is a medium-mu triode unit used as a blocking oscillator in vertical deflection circuits, and unit No.2 is a low-mu triode unit used as a vertical deflection amplifier. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

- **Heater Voltage (ac/dc):** 10 volts
- **Heater Current:** 0.6 ampere
- **Heater Warm-Up Time (Average):** 11 seconds

### VERTICAL DEFLECTION OSCILLATOR AND AMPLIFIER

DETECTOR AMPLIFIER

Glass types used as detectors and amplifiers in battery-operated receivers. Filament volts (dc), 1.1; amperes, 0.25. Typical operation as class A1 amplifier: plate volts, 135 ma.; grid volts, -10.5; plate resistance, 15500 ohms; transconductance, 440 µhos; plate ma., 5. These are DISCONTINUED types listed for reference only.

POWER PENTODE

Glass type used as output amplifier in ac/dc radio receivers. Outline 34 or 35, OUTLINES SECTION. Heater volts (ac/dc), 12.6 in series heater arrangement and 6.3 in parallel arrangement; amperes, 0.3 (series), 0.6 (parallel). Typical operation as class A1 amplifier: plate volts and grid-No.2 volts, 180 ma.; grid-No.1 volts, -25; plate ma., 45; grid-No.2 ma., 8; plate resistance, 35000 ohms; transconductance, 2400 µhos; load resistance, 3300 ohms; output watts, 3.4. This is a DISCONTINUED type listed for reference only.

RECTIFIER—POWER PENTODE

Glass type used as combined half-wave rectifier and power amplifier. Outline 40, OUTLINES SECTION. Tube requires small seven-contact (0.75-inch, pin-circle diameter) socket. Heater volts (ac/dc), 12.6; amperes, 0.3. Typical operation of pentode unit as class A1 amplifier: plate volts and grid-No.2 volts, 135 ma.; grid-No.1 volts, -13.5; load resistance, 15500 ohms; plate resistance, 100000 ohms; transconductance, 975 µhos; cathode-bias resistor, 1175 ohms; plate ma., 9; grid-No.2 ma., 2.5; output watts, 0.55. Maximum ratings of rectifier unit with capacitor input filter: ac plate volts (rms), 155; dc output ma., 36. This is a DISCONTINUED type listed for reference only.

PENTAGRID CONVERTER

Glass octal type used as converter in ac/dc receivers. Outline 23, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with glass octal type 6A8-GT. Type 12A8-GT is used principally for testing purposes.

BEAM POWER TUBE

Miniature type used in the output stage of automobile radio receivers operating from a 12-volt storage battery. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.
### Technical Data

**HEATER-VOLTAGE RANGE (AC/DC)**  
10.0 to 15.9 volts

**HEATER CURRENT (Approx.) at 12.6 volts**  
0.2 amperes

**DIRECT INTERELECTRODE CAPACITANCES:**  
- Grid No.1 to Plate  
  0.7 max μf  
- Grid No.1 to Cathode, Heater, Grid No.2, and Grid No.3  
  8 μf  
- Plate to Cathode, Heater, Grid No.2, and Grid No.3  
  8.5 μf

*This voltage range is on an absolute basis. For longest life, it is recommended that the heater be operated within the voltage range of 11 to 14 volts.*

### CLASS A1 AMPLIFIER

**Maximum Ratings:**

- **Plate Voltage**  
  315 max volts
- **Grid-No.2 (Screen-Grid) Voltage**  
  285 max volts
- **Plate Disipation**  
  12 max watts
- **Grid-No.2 Input**  
  2 max watts
- **Peak Heater-Cathode Voltage:**  
  - Heater negative with respect to cathode  
    90 max volts  
  - Heater positive with respect to cathode  
    90 max volts
- **Bulb Temperature (At hottest point)**  
  250 max °C

**Typical Operation with 12.6 Volts on Heater:**

* This voltage range is on an absolute basis. For longest life, it is recommended that the heater be operated within the voltage range of 11 to 14 volts.

* External shield connected to cathode.

### CONVERTER SERVICE

**Maximum Ratings:**
- **Plate Voltage**: 30 max volts
- **Grids-No.2-and-No.4 Supply Voltage**: 30 max volts
- **Grids-No.2-and-No.4 Voltage**: 30 max volts
- **Grid-No.3 Voltage**: Negative bias value: -30 max volts, Positive bias value: 0 max volts
- **Total Cathode Current**: 20 max ma

**Peak Heater-Cathode Voltage:**
- Heater negative with respect to cathode: 30 max volts
- Heater positive with respect to cathode: 30 max volts

**Typical Operation with 12.6 Volts on Heater (Separate Excitation):**
- Plate Voltage: 12.6 volts
- Grids-No.2-and-No.4 Voltage: 12.6 volts
- Grid-No.3 (Control-Grid) Voltage: 0 volts
- Grid-No.1 (Oscillator-Grid) Voltage (rms): 1.6 volts
- Grid-No.3 Resistor: 2.2 megohms
- Grid-No.1 Resistor: 33000 ohms
- Plate Resistance (Approx.): 1.0 megohm
- Conversion Transconductance: 260 µhmhos
- Grid-No.3 Voltage (Approx.) for conversion transconductance of 5 µhmhos: -2.2 volts
- Grid-No.3 Voltage (Approx.) for conversion transconductance of 20 µhmhos: -1.8 volts
- Plate Current: 0.45 ma
- Grids-No.2-and-No.4 Current: 1.5 ma
- Grid-No.1 Current: 0.05 ma
- Total Cathode Current: 2 ma

**Maximum Circuit Value:**
- Grid-No.3-Circuit Resistance: 10 max megohms

**NOTE:** The transconductance between grid No.1 and grids No.2 and No.4 connected to plate (not oscillating) is approximately 3800 amhos under the following conditions: heater at 12.6 volts, grids No.2 and No.4 and plate at 12.6 volts, grids No.1 and No.3 at 0 volts. Under the same conditions, the cathode current is 5 ma and the amplification factor is 9.
TWIN DIODE— MEDIUM-MU TRIODE

Miniature type used as combined detector and af voltage amplifier in automobile radio receivers operating from a 12-volt storage battery. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

HEATER-VOLTAGE RANGE (AC/DC)* .................................. 10.0 to 15.9 volts
HEATER CURRENT (Approx.) at 12.6 volts .......................... 0.15 ampere
DIRECT INTERELECTRODE CAPACITANCES:
- Triode Grid to Triode Plate .................................. 2.0 μf
- Triode Grid to Cathode and Heater ............................ 1.8 μf

**DIODE UNITS**

**TWIN DIODE**

Miniature, high-perveance type used as detector in FM and television circuits. It is especially useful as a ratio detector in ac/dc FM receivers. Outline 9, OUTLINES SECTION. Heater volts (ac/dc), 12.8; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6AL5.

![12AL5](image)

**BEAM POWER TUBE**

Miniature type used as output amplifier primarily in automobile radio receivers operating from a 12-volt storage battery. Outline 13, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.225. Except for heater rating, this type is identical with miniature type 6AQ5. Within its maximum ratings, the performance of the 12AQ5 is equivalent to that of the larger type 12V6-GT.

![12AQ5](image)

**TWIN DIODE—HIGH-MU TRIODE**

Miniature type used as combined detector, amplifier, and a/vc tube in compact ac/dc radio receivers. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6AT6.

![12AT6](image)

**HIGH-MU TWIN TRIODE**

Miniature type used as push-pull cathode-drive amplifier or frequency converter in the FM and television broadcast bands. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Each triode unit is independent of the other except for the common heater.

SHARP-CUTOFF PENTODE

Miniature type used in compact ac/dc radio equipment as an rf amplifier especially in high-frequency, wide-band applications. Outline 11, OUT-LINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6AU6.
MEDIUM-MU TWIN TRIODE

12AU7
12AU7-A

Miniature types used as phase inverter or push-pull amplifier in ac/dc radio equipment and in diversified applications such as multivibrators or oscillators in industrial control devices. Also used as combined vertical oscillator and vertical deflection amplifier, and as horizontal deflection oscillator, in television receivers. Outline 12, OUTLINES SECTION. Tubes require miniature nine-contact socket and may be mounted in any position. Each triode unit is independent of the other except for the common heater. For typical operation as a resistance-coupled amplifier, refer to Chart 8, RESISTANCE-COUPLED AMPLIFIER SECTION. Type 12AU7-A has a strengthened mount structure to reduce microphonic effect.

Grid Voltage (Approx.) for plate current of 10 μa ....... -5 -12 volts

SHARP-CUTOFF PENTODE

Miniature type used as an rf or if amplifier up to 400 megacycles in compact ac/dc FM receivers. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater ratings and terminal connections, this type is identical with miniature type 6AG5. Type 12AW6 is used principally for renewal purposes.

12AX4-GT

HALF-WAVE VACUUM RECTIFIER

Glass octal types used as damper tubes in horizontal deflection circuits of television receivers. Type 12AX4-GTA has a controlled heater warm-up time for use in series-connected heater strings. Outline 22, OUTLINES SECTION. These types may be supplied with pin No.1 omitted. Heater volts (ac/dc), 12.6; amperes, 0.6; warm-up time (average) for 12AX4-GTA, 11 seconds. Except for heater rating, these types are identical with glass octal type 6AX4-GT. Type 12AX4-GT is a DISCONTINUED type listed for reference only.

12AX7

HIGH-MU TWIN TRIODE

Miniature type used as phase inverter or twin resistance-coupled amplifier in radio equipment and in diversified applications such as multivibrators or oscillators in industrial control devices. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Each triode unit is independent of the other except for common heater. For characteristics and curves, refer to type 6AV6. For typical operation as a resistance-coupled amplifier, refer to Chart 15, RESISTANCE-COUPLED AMPLIFIER SECTION.

MEDIUM-MU TWIN TRIODE

Miniature type used in the first stages of high-gain audio-frequency amplifiers where reduction of microphonics, leakage noise, and hum are primary considerations. Outline 12,
OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Each triode unit is independent of the other except for the common heater. Use of the 12.6-volt connection with an ac heater supply is not recommended for applications involving low hum. For typical operation as a resistance-coupled amplifier, refer to Chart 18, RESISTANCE-COUPLED AMPLIFIER SECTION.

- Plate Current: 8 ma

AVERAGE CHARACTERISTICS EACH UNIT

HIGH-MU TWIN TRIODE

Miniature type used in direct-coupled cathode-drive rf amplifier circuits of vhf television tuners. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc): 12.6 in series arrangement, 6.3 in parallel arrangement; amperes, 0.225 (series), 0.45 (parallel). Peak heater-cathode volts, 200 max. When the heater is positive with respect to the
cathode, the dc component of the heater-cathode voltage must not exceed 100 volts. Except for heater and heater-cathode ratings and interelectrode capacitances, this type is identical with miniature type 12AT7.

DIRECT INTERELECTRODE CAPACITANCES (Approx.):
- Grid to Plate (Each Unit) .................................................. 1.9 μf
- Grid to Heater and Cathode (Each Unit) .................................. 3.1 μf
- Plate to Heater and Cathode (Unit No.1) .................................. 0.5 μf

  - For cathode-bias operation ........................................... 2.5 max megohms

VERTICAL DEFLECTION AMPLIFIER

For operation in a 525-line, 30-frame system

Maximum Ratings:
- DC PLATE VOLTAGE .......................................................... 550 max volts
- PEAK POSITIVE-PULSE PLATE VOLTAGE* (Absolute Maximum) ........... 1000 max volts
- PEAK NEGATIVE-PULSE GRID VOLTAGE .................................... -250 max volts
- PEAK CATHODE CURRENT .................................................. 105 max ma
- AVERAGE CATHODE CURRENT ............................................. 30 max ma
- PLATE DISSIPATION .......................................................... 5.5 max watts
- PEAK HEATER-CATHODE VOLTAGE:
  - Heater negative with respect to cathode .......................... 200 max volts
  - Heater positive with respect to cathode .......................... 2000 max volts

Maximum Circuit Value:
- Grid-Circuit Resistance .................................................. 2.2 max megohms

* The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.

The above values should never be exceeded.

For cathode-bias operation ............................................. 2.2 max megohms

The dc component must not exceed 100 volts.

264
TRIODE—PENTODE
Glass octal type used as combined detector and rf or if amplifier in ac/dc receivers. Heater volts (ac/dc), 12.6; amperes, 0.3. Characteristics of triode unit: plate volts, 90; grid volts, 0; amplification factor, 90; plate resistance, 3700 ohms; transconductance, 2400 µmhos; plate ma., 2.3. Characteristics of pentode unit: plate volts, 90; grid-No.2 volts, 90; grid-No.1 volts, -3; plate resistance, 200000 ohms; transconductance, 1800 µmhos; plate ma., 7; grid-No.2 ma., 2. This is a DISCONTINUED type listed for reference only.

REMOTE-CUTOFF PENTODE
Miniature type used as rf amplifier in ac/dc standard broadcast receivers, in FM receivers, and in other wide-band, high-frequency applications. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater ratings, this type is identical with miniature type 6BA6.

PENTAGRID CONVERTER
Miniature type used as converter in ac/dc superheterodyne circuits especially those for the FM broadcast band. Outline 14, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6BA7.

REMOTE-CUTOFF PENTODE
Miniature type used as rf or if amplifier in radio receivers. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6BD6. Type 12BD6 is used principally for renewal purposes.

PENTAGRID CONVERTER
Miniature type used as converter in ac/dc receivers for both standard broadcast and FM bands. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6BE6.

TWIN DIODE—MEDIUM-MU TRIODE
Miniature type used as combined detector, amplifier, and avc tube primarily in automobile radio receivers operating from a 12-volt storage battery. Outline 11, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6BF6.
MEDIUM-MU TWIN TRIODE

12BH7
12BH7-A

Miniature types used as combined vertical deflection amplifiers and vertical oscillators, and as horizontal deflection oscillators, in television receivers. Type 12BH7-A has a controlled heater warm-up time for use in series-connected heater strings. These types are also used in other applications including phase-inverter circuits and multivibrator circuits. Outline 14, OUTLINES SECTION. Tubes require miniature nine-contact socket and may be mounted in any position. Each triode unit is independent of the other except for the common heater. Type 12BH7 is a DISCONTINUED type listed for reference only.

**Maximum Circuit Values:**
- Grid-No.1-Circuit Resistance:
  - For fixed-bias operation: 0.1 max megohm
  - For cathode-bias operation: 0.5 max megohm
- The dc component must not exceed 100 volts.

### REMOTE-CUTOFF PENTODE

**12CN5**

Miniature type used as if amplifier in automobile radio receivers operating from a 12-volt storage battery. Outline 13, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

**Heater-Voltage Range (AC/DC)**: 10.0 to 15.9 volts
**Heater Current (Approx.) at 12.6 volts**: 0.45 amperes

**Class A1 Amplifier**

**Maximum Ratings:**
- **Plate Voltage**: 16 max volts
- **Grid-No.2 (Screen-Grid) Voltage**: 16 max volts
- **Grid-No.1 (Control-Grid) Voltage, Positive bias value**: 0 max volts
- **Peak Heater-Cathode Voltage:**
  - Heater negative with respect to cathode: 16 max volts
  - Heater positive with respect to cathode: 16 max volts

**Characteristics with 12.6 Volts on Heater:**
- Plate Voltage: 12.6 volts
- Grid-No.2 Voltage: 12.6 volts
- Grid-No.1 Supply Voltage: 4 volts
- Grid-No.1 Resistor (Bypassed): 2.2 megohms
- Plate Resistance (Approx.): 40000 ohms
- Transconductance: 3800 μmhos
- Grid Current: 4.5 ma
- Grid-No.2 Current: 3.5 ma

**Maximum Circuit Value:**
- Grid-No.1-Circuit Resistance: 2.2 max megohms
- This voltage range is on an absolute basis. For longest life, it is recommended that the heater be operated within the voltage range of 11 to 14 volts.

### DIODE—REMOTE-CUTOFF PENTODE

**12CR6**

Miniature type used as combined detector and audio amplifier in automobile and ac-operated radio receivers. The diode unit is used as an AM detector, and the pentode unit as an automatic-volume-controlled audio amplifier. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

**Heater Voltage (AC/DC)**: 12.6 volts
**Heater Current**: 0.15 amperes

**Pentode Unit as Class A1 Amplifier**

**Maximum Ratings:**
- **Plate Voltage**: 300 max volts
- **Grid-No.2 (Screen-Grid) Voltage**: See curve page 69
- **Grid-No.2 Supply Voltage**: 300 max volts

272
GRID-NO.1 (CONTROL-GRID) VOLTAGE, Positive bias value

BEAM POWER TUBE

Miniature types used in the audio output stage of television receivers employing series-connected heater strings.
Outline 13, OUTLINES SECTION.
Heater volts (ac/dc), 12.6; amperes, 0.6; warm-up time (average), 11 seconds. Except for heater rating, these types are identical with miniature type 6CU5. Type 12CU5 is a DISCONTINUED type listed for reference only.

SHARP-CUTOFF PENTODE

Miniature type used as rf amplifier in automobile radio receivers operating from a 12-volt storage battery. Outline 11, OUTLINES SECTION.
Tube requires miniature seven-contact socket and may be mounted in any position.

HEATER-VOLTAGE RANGE (ac/dc)*
10.0 to 15.9 volts
HEATER CURRENT (Approx.) at 12.6 volts
0.15 ampere

* This voltage range is on an absolute basis. For longest life, it is recommended that the heater be operated within the voltage range of 11 to 14 volts.
RCA Receiving Tube Manual

CLASS A 1 AMPLIFIER

Maximum Ratings (Design-Maximum Values):

PLATE VOLTAGE: ........................................... 38 max volts
GRID-No.2 (SCREEN-GRID) VOLTAGE: .................. 33 max volts
GRID-No.1 (CONTROL-GRID) VOLTAGE: Positive bias value. 0 max volts

PEAK HEATER-CATHODE VOLTAGE:
Heater negative with respect to cathode: 30 max volts
Heater positive with respect to cathode: 30 max volts

Characteristics with 12.6 Volts on Heater:
Plate Voltage: ........................................... 12.6 volts
Grid-No.3 (Suppressor-Grid) Voltage: .................. 0 volts
Grid-No.2 Voltage: ........................................ 12.6 volts
Grid-No.1 Supply Voltage: ................................ 0 volts
Grid-No.1 Resistor (Bypassed): .......................... 2.2 megohms
Plate Resistance (Approx.): ............................... 40000 ohms
Transconductance: ......................................... 3100 µmhos
Grid-No.1 Voltage (Approx.) for plate current of 10 ma: −4.5 volts
Plate Current: ............................................. 3 ma
Grid-No.2 Current: ......................................... 1.4 ma

Maximum Circuit Value:
Grid-No.1-Circuit Resistance: ................................ 10 max megohms

HALF-WAVE VACUUM RECTIFIER

Glass octal type used as damper diode in horizontal-deflection circuits of television receivers employing series-connected heater strings. Outline 22, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

HEATER VOLTAGE (AC/DC) ................................ 12.6 volts
HEATER CURRENT ........................................ 0.6 ampere
HEATER WARM-UP TIME (Average) ....................... 11 seconds

DAMPER SERVICE

For operation in a 525-line, 30-frame system

Maximum Ratings (Design-Maximum Values):

PEAK INVERSE PLATE VOLTAGE# .......................... 4400 max volts
PEAK PLATE CURRENT ....................................... 900 max ma
DC PLATE CURRENT .......................................... 155 max ma
PLATE DISSIPATION .......................................... 5.5 max watts
PEAK HEATER-CATHODE VOLTAGE:
Heater negative with respect to cathode: 4400*max volts
Heater positive with respect to cathode: 300*max volts

# The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
* The dc component must not exceed 900 volts.
** The dc component must not exceed 100 volts.

TWIN DIODE—POWER TETRODE

Miniature type used as combined detector and power amplifier driver in automobile radio receivers operating from a 12-volt storage battery. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

HEATER-VOLTAGE RANGE (AC/DC)* .......................... 10.0 to 15.9 volts
HEATER CURRENT (Approx.) at 12.6 volts .......................... 0.4 ampere

DIRECT INTERELECTRODE CAPACITIES:
Tetrode Unit:
Grid No.2 to Plate ........................................ 14 µf
Grid No.2 to Cathode, Heater, and Grid No.1 ................. 12 µf
Plate to Cathode, Heater, and Grid No.1 ....................... 1.3 µf
Diode Units:
Plate to Cathode and Heater (Each unit) ...................... 1.6 µf
Plate of Unit No.1 to Plate of Unit No.2 ...................... 0.03 µf
Tetrode Grid No.2 to Plate of Diode Unit No.1 ................ 0.02 max µf
Tetrode Grid No.2 to Plate of Diode Unit No.2 ............... 0.006 max µf

* This voltage range is on an absolute basis. For longest life, it is recommended that the heater be operated within the voltage range of 11 to 14 volts.

**TWIN DIODE**

Metal type used as detector, low-voltage rectifier, or vco tube in ac/dc radio receivers. Outline 1, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with metal type 6H6.
MEDIUM-MU TRIODE

12J5-GT

Glass octal type used as detector, amplifier, or oscillator in ac/dc radio equipment. Outline 24, OUTLINES SECTION. This type may be supplied with pin No.1 omitted. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with glass-octal type 6J5-GT. Type 12J5-GT is used principally for renewal purposes.

SHARP-CUTOFF PENTODE

12J7-GT

Glass octal type used as biased detector or high-gain audio amplifier in ac/dc radio receivers. Outline 23, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with glass-octal type 6J7-GT. Type 12J7-GT is used principally for renewal purposes.

TWIN DIODE—POWER TETRODE

12J8

Miniature type used as combined detector and audio driver in automobile radio receivers operating from a 12-volt storage battery. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

HEATER-VOLTAGE RANGE (AC/DC)* ........................................ 10.0 to 15.9 volts
HEATER CURRENT (APPROX.) at 12.6 volts ................................ 0.325 ma
* This voltage range is on an absolute basis. For longest life, it is recommended that the heater be operated within the voltage range of 11 to 14 volts.

**POWER TETRODE**

Miniature type used as power amplifier driver in automobile radio receivers operating from a 12-volt storage battery. Outline 13, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Heater-voltage range (ac/dc), 10.0 to 15.9; amperes (approx.) at 12.6 volts, 0.4. Maximum ratings and characteristics are the same as those of the tetrode unit of miniature type 12DL8.

**REMOTE-CUTOFF PENTODE**

Glass octal type used as rf or if amplifier in ac/dc radio receivers particularly those employing avc. Outline 23, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with glass octal type 6K7-GT. Type 12K7-GT is used principally for renewal purposes.

**TRIODE—HEXODE CONVERTER**

Metal type used as combined triode oscillator and hexode mixer in ac/dc radio receivers. Outline 5, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with metal type 6K8. Type 12K8 is used principally for renewal purposes.

**BEAM POWER TUBE**

Glass octal type used in audio output stages of television receivers employing series-connected heater strings. Outline 22, OUTLINES SECTION. This type may be supplied with pin No.1 omitted. Heater volts (ac/dc), 12.6; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts: heater negative with respect to cathode, 300 max; heater positive with respect to cathode, 200 max (the dc component must not exceed 100 volts). Except for heater and heater-cathode ratings, this type is identical with glass octal type 50L6-GT.

**TWIN DIODE—HIGH-MU TRIODE**

Glass octal type used as combined detector, amplifier, and avc tube in ac/dc radio receivers. Outline 23, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with glass octal type 6Q7-GT. Type 12Q7-GT is used principally for renewal purposes.

**BEAM POWER TUBE**

Miniature type used as a vertical deflection amplifier in television receivers employing series-connected heater strings. Outline 13, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position.

Maximum Circuit Value:
| Grid-No.1 Circuit Resistance:              | 2.2 max megohms |

† The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.

TRIPLE DIODE—HIGH-MU TRIODE

Glass octal type used as audio amplifier, AM detector, and FM detector in AM/FM receivers. Outline 21, OUTLINES SECTION, except over-all length is 3.9 1/16 max inches and seated height is 3 max inches. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with glass octal type 6S8-GT. Type 12S8-GT is a DISCONTINUED type listed for reference only.

PENTAGRID CONVERTER

Metal type 12SA7 and glass octal type 12SA7-GT used as converter in ac, dc receivers. Outlines 3 and 22, respectively, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater ratings, these types are identical with metal type 6SA7 and glass octal type 6SA7-GT. Type 12SA7-GT is used principally for renewal purposes.

HIGH-MU TWIN TRIODE

Metal type used as phase inverter or voltage amplifier in ac/dc radio equipment. Outline 3, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with metal type 6SC7.

HIGH-MU TRIODE

Metal type 12SF5 and glass octal type 12SF5-GT used in resistance-coupled amplifier circuits of ac/dc radio equipment. Outline 3 and 22, respectively, OUTLINES SECTION. Type 12SF5-GT may be supplied with pin No.1 omitted. Heater volts (ac/dc),

286
12.6; amperes, 0.15. Except for heater rating, these types are identical with metal type 6SF5 and glass octal type 6SF5-GT, respectively. Type 12SF5-GT is a DISCONTINUED type listed for reference only.

**DIODE—REMOTE-CUTOFF PENTODE**

Metal type used as combined rf or if amplifier and detector or a/cv tube in a/c/dc radio receivers. Outline 3, OUTLINES SECTION. Heater volts (a/c/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with metal type 6SF7. Type 12SF7 is used principally for renewal purposes.

**REMOTE-CUTOFF PENTODE**

Metal type used as rf amplifier in a/c/dc receivers involving high-frequency, wide-band applications. Outline 3, OUTLINES SECTION. Heater volts (a/c/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with metal type 6SG7.

**SHARP-CUTOFF PENTODE**

Metal type used as rf amplifier in a/c/dc receivers involving high-frequency, wide-band applications and as limiter tube in FM equipment. Outline 3, OUTLINES SECTION. Heater volts (a/c/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with metal type 6SH7.

**SHARP-CUTOFF PENTODE**

Metal type 12SJ7 and glass-octal type 12SJ7-GT used as rf amplifiers and biased detectors in a/c/dc radio receivers. Outlines 3 and 24, respectively, OUTLINES SECTION. Heater volts (a/c/dc), 12.6; amperes, 0.15. Except for heater rating, these types are identical with metal-type 6SJ7 and glass-octal type 6SJ7-GT. Type 12SJ7-GT is a DISCONTINUED type listed for reference only.

**REMOTE-CUTOFF PENTODE**

Metal type 12SK7 and glass octal type 12SK7-GT used as rf and if amplifiers in a/c/dc radio receivers. Outlines 3 and 24, respectively, OUTLINES SECTION. Heater volts (a/c/dc), 12.6; amperes, 0.15. Except for heater rating, these types are identical with metal type 6SK7 and glass octal type 6SK7-GT. Type 12SK7-GT is used principally for renewal purposes.

**HIGH-MU TWIN TRIODE**

Glass octal type used as phase inverter or resistance-coupled amplifier in a/c/dc radio equipment. Outline 22, OUTLINES SECTION. Heater volts (a/c/dc), 12.6; amperes, 0.15. Except for heater rating, this type is identical with glass octal type 6SL7-GT.
MEDIUM-MU TWIN TRIODE

**12SN7-GT**

Glass octal type used as phase inverter or resistance-coupled amplifier in ac/dc radio equipment. Outline 22, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.3. Except for heater rating, this type is identical with glass octal type 6SN7-GT.

TWIN DIODE—HIGH-MU TRIODE

**12SQ7**  
**12SQ7-GT**

Metal type 12SQ7 and glass octal type 12SQ7-GT used as combined detector, amplifier, and cvc tube in ac/dc radio receivers. Outlines 3 and 24, respectively, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, these types are identical with metal type 6SQ7 and glass octal type 6SQ7-GT.

TWIN DIODE—MEDIUM-MU TRIODE

**12SR7**  
**12SR7-GT**

Metal type 12SR7 and glass octal type 12SR7-GT used as combined detector, amplifier, and cvc tube in ac/dc radio receivers. Outlines 3 and 22, respectively, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, type 12SR7 is identical with type 6SR7, and type 12SR7-GT is electrically identical with type 6SR7 except for interelectrode capacitances. The 12SR7-GT is a DISCONTINUED type listed for reference only. Both types are similar in performance to miniature type 6BF6.

BEAM POWER TUBE

**12V6-GT**

Glass octal type used as output amplifier primarily in automobile radio receivers operating from a 12-volt storage battery. Outline 22, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 12.6; amperes, 0.225. Except for heater rating, this type is identical with glass octal type 6V6-GT.

BEAM POWER TUBE

**12W6-GT**

Glass octal type used in the audio output stages of television receivers employing series-connected heater strings. Triode-connected, this type is used as a vertical deflection amplifier. Outline 22, OUTLINES SECTION. This type may be supplied with pin No.1 omitted. Heater volts (ac/dc), 12.6; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts: heater negative with respect to cathode, 300 max (the dc component must not exceed 200 volts); heater positive with respect to cathode, 200 max (the dc component must not exceed 100 volts). Except for heater and heater-cathode ratings, this type is identical with glass octal type 6W6-GT.
FULL-WAVE VACUUM RECTIFIER

Miniature type used in power supply of automobile radio receivers operating from a 12-volt storage battery. Outline 13, OUTLINES SECTION. Heater volts (ac/dc), 12.6; amperes, 0.3. Except for heater rating, this type is identical with miniature type 6X4.

FULL-WAVE VACUUM RECTIFIER

Glass types used in power supply of ac/dc receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires four-contact socket. Heater volts (ac/dc), 12.6; amperes, 0.3. Maximum ratings as half-wave rectifier: peak inverse plate volts, 700 max; peak plate ma., 330 max; dc output ma., 55 max; peak heater-cathode volts, 350 max. This is a DISCONTINUED type listed for reference only.

MEDIUM-MU TRIODE

Glass lock-in type used as detector, amplifier, or oscillator in ac/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating and capacitances, this type is electrically identical with lock-in type 7A4 and metal type 6J5. Type 14A4 is a DISCONTINUED type listed for reference only.

BEAM POWER TUBE

Glass lock-in type used as output amplifier in ac/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Typical operation and ratings as class A: amplifier: plate volts and grid-No.2 volts, 250 (300 max); plate dissipation, 7.5 watts; grid-No.2 input, 1.5 watts; grid-No.1 volts, -12.5; plate ma., 32; grid-No.2 ma., 5.5; plate resistance, 70000 ohms; transconductance, 3000 amhos; load resistance, 7500 ohms; output watts, 2.8. This is a DISCONTINUED type listed for reference only.

REMOTE-CUTOFF PENTODE

Glass lock-in type used as rf or if amplifier in ac/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating and capacitances, this type is electrically identical with metal type 8SK7 and lock-in type 7A7. Type 14A7 is used principally for renewal purposes.

MEDIUM-MU TWIN TRIODE

Glass lock-in type used as voltage amplifier or phase inverter in radio equipment. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater ratings, this type is electrically identical with lock-in type 7AF7. Type 14AF7 is used principally for renewal purposes.
**TWIN DIODE—HIGH-MU TRIODE**

Glass lock-in type used as combined detector, amplifier, and a/v tube in a/c/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater voltage (a/c/dc), 12.6; amperes, 0.15. Except for heater rating and capacitance, this type is electrically identical with lock-in type 7B6 and metal type 6SQ7. Type 14B6 is used principally for renewal purposes.

**PENTAGRID CONVERTER**

Glass lock-in type used as converter in a/c/d/c radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater voltage (a/c/dc), 12.6; amperes, 0.15. Except for heater rating and capacitance, this type is electrically identical with lock-in type 7B8 and metal type 6A8. Type 14B8 is a DISCONTINUED type listed for reference only.

**BEAM POWER TUBE**

Glass lock-in type used as output amplifier in a/c/d/c radio receivers. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater voltage (a/c/dc), 12.6; amperes, 0.25. Except for heater rating, this type is electrically identical with lock-in type 7E5 and metal type 6Y6. Type 14C5 is a DISCONTINUED type listed for reference only.

**SHARP-CUTOFF PENTODE**

Glass lock-in type used as rf amplifier and biased detector in a/c/d/c radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater voltage (a/c/dc), 12.6; amperes, 0.15. Typical operation and maximum ratings as class A1: amplifier: plate voltage, 250 (300 max); grid-No.2 voltage, 100; plate dissipation, 1 max watt; grid-No.2 input, 0.1 max watt; grid-No.1 voltage, -3; grid-No.3 connected to cathode at socket; plate resistance, greater than 1 megohm; transconductance, 1575 μmhos; plate ma., 2.2; grid-No.2 ma., 0.7. Within the limits of its maximum ratings, this type is similar in performance to metal types 6SJ7 and 12SJ7. Type 14C7 is used principally for renewal purposes.

**TWIN DIODE—MEDIUM-MU TRIODE**

Glass lock-in type used as combined detector, amplifier, and a/v tube in a/c/d/c radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater voltage (a/c/dc), 12.6; amperes, 0.15. Except for heater rating, this type is electrically identical with lock-in type 7E6 and miniature type 6B6. Type 14E6 is a DISCONTINUED type listed for reference only.

**TWIN DIODE—REMOTE-CUTOFF PENTODE**

Glass lock-in type used as combined detector, amplifier, and a/v tube in a/c/d/c receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater voltage (a/c/dc), 12.6; amperes, 0.15. Except for heater rating, this type is electrically identical with lock-in type 7E7. Type 14E7 is a DISCONTINUED type listed for reference only.
HIGH-MU TWIN TRIODE
Glass lock-in type used as phase inverter or resistance-coupled amplifier in ac/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is electrically identical with lock-in type 7F7 and glass-oval type 6SL7-GT. Type 14F7 is used principally for renewal purposes.

MEDIUM-MU TWIN TRIODE
Glass lock-in type used as amplifier or oscillator in ac/dc radio equipment. Outline 15, OUTLINES SECTION. Except over-all length is 2-9/32 max inches and seated length is 1-5/4 inches. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is electrically identical with lock-in type 7F8. Type 14F8 is used principally for renewal purposes.

REMOTE-CUTOFF PENTODE
Glass lock-in type used as rf or if amplifier in ac/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is electrically identical with type 7H7. Type 14H7 is a DISCONTINUED type listed for reference only.

TRIODE—HEPTODE CONVERTER
Glass lock-in type used as combined triode oscillator and heptode mixer in ac/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is electrically identical with lock-in type 7J7. Type 14J7 is a DISCONTINUED type listed for reference only.

MEDIUM-MU TWIN TRIODE
Glass lock-in type used as voltage amplifier or phase inverter in ac/dc radio equipment. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.3. Except for heater rating and capacitances, this type is electrically identical with lock-in type 7N7 and glass-oval type 6SN7-GT. Type 14N7 is a DISCONTINUED type listed for reference only.

PENTAGRID CONVERTER
Glass lock-in type used as converter in ac/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater ratings and capacitances, this type is electrically identical with metal type 6A7 and lock-in type 7Q7. Type 14Q7 is used principally for renewal purposes.

TWIN DIODE—REMOTE-CUTOFF PENTODE
Glass lock-in type used as combined detector, amplifier, and avc tube in ac/dc radio receivers. Outline 15, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 12.6; amperes, 0.15. Except for heater rating, this type is electrically identical with lock-in type 7R7. Type 14R7 is used principally for renewal purposes.
SHARP-CUTOFF PENTODE

Glass type used as rf amplifier in battery-operated receivers. Outline 40, OUTLINES SECTION. Tube requires five-contact socket. Heater volts (dc), 2.0; amperes, 0.22. Typical operation as class A; amplifier: plate volts, 135 max; grid-No.2 (screen-grid) volts, 67.5 max; grid-No.1 volts, −1.5; plate ma., 1.85; grid-No.2 ma., 0.9; plate resistance, 0.80 megohm; transconductance, 750 μmhos. This is a DISCONTINUED type listed for reference only.

HALF-WAVE VACUUM RECTIFIER

17AX4-GT

Glass octal type used as a damper tube in horizontal deflection circuits of television receivers employing series-connected heater strings. Outline 22, OUTLINES SECTION. Heater volts (ac/dc), 16.8; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with glass octal type 6AX4-GT.

BEAM POWER TUBE

17BQ6-GTB

Glass octal type used as horizontal deflection amplifier in television receivers employing series-connected heater strings. Outline 30, OUTLINES SECTION. Heater volts (ac/dc), 16.8; amperes, 0.45; warm-up time (average), 11 seconds. Except for heater rating, this type is identical with glass octal type 6BQ6-GTB/6CU6.

BEAM POWER TUBE

17DQ6-A

Glass octal type used as horizontal deflection amplifier in television receivers employing series-connected heater strings. Outline 37, OUTLINES SECTION. Heater volts (ac/dc), 16.8; amperes, 0.45; warmup time (average), 11 seconds. Except for heater rating, this type is identical with glass octal type 6DQ6-A.

HIGH-MU TWIN POWER TRIODE

Glass type used in output stage of battery-operated receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires six-contact socket. Filament volts (dc), 2.0; amperes, 0.26. Except for filament current, this type is electrically identical with type 1J6-GT. Type 19 is a DISCONTINUED type listed for reference only.

HALF-WAVE VACUUM RECTIFIER

19AU4

Glass octal type used as damper diode in horizontal-deflection circuits of black-and-white television receivers employing series-connected heater strings. Outline 29, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. It is especially important that this tube, like other power-handling tubes, be adequately ventilated. For curve of average plate characteristics, see page 64.

| HEATER VOLTAGE (ac/dc) | 18.9 | volts |
| HEATER CURRENT | 0.6 | ampere |
| HEATER WARM-UP TIME (Average) | 11 | seconds |
DIRECT INTERELECTRODE CAPACITANCES (APPROX.):
Plate to Heater and Cathode .......................... 8.5 µF
Cathode to Heater and Plate .......................... 11.6 µF
Heater to Cathode ..................................... 4.0 µF

DAMPER SERVICE
For operation in a 525-line, 30-frame system

Maximum Ratings:
PEAK INVERSE PLATE VOLTAGE# (Absolute maximum) ......................... 4500 volts max
PEAK PLATE CURRENT .................................. 1050 ma max
DC PLATE CURRENT .................................. 175 ma max
PLATE DISSIPATION .................................. 6 ma watts max
PEAK HEATER-CATHODE VOLTAGE:
Heater negative with respect to cathode .................................. 4500 volts max
Heater positive with respect to cathode .................................. 300 volts max

# The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

◊ Under no circumstances should this absolute value be exceeded.
† The dc component must not exceed 900 volts.
‡ The dc component must not exceed 100 volts.

BEAM POWER TUBE
Glass octal type used as output amplifiers in horizontal deflection circuits of television equipment of the "transformerless" type where high pulse voltages occur during short duty cycles. Outlines 52 and 46, respectively, OUTLINES SECTION. Tubes require octal socket. Vertical tube mounting is preferred but horizontal operation is permissible if pins No.2 and No.7 are in vertical plane. Heater volts (ac/dc), 18.9; amperes, 0.3. Except for heater rating and interelectrode capacitances, type 19BG6-GA is electrically identical with glass octal type 6BG6-G. Type 19BG6-G is a DISCONTINUED type listed for reference only. Type 19BG6-GA is used principally for renewal purposes.

MEDIUM-MU TWIN TRIODE
Miniature type used for converter service in ac/dc AM and FM receivers and as oscillator, amplifier, or mixer in television receivers of the "transformerless" type. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Heater volts (ac/dc), 18.9; amperes, 0.15. For direct interelectrode capacitances, ratings, and typical operation as a class A amplifier, and curves, refer to type 6J6. Maximum ratings and characteristics for mixer service (each unit): plate volts, 150 (300 max); cathode-bias resistor, 810 ohms; peak oscillator volts, 3; plate resistance, 10200 ohms; conversion transconductance, 1900 µhos; plate ma, 4.8; plate dissipation, 1.5 max watts; peak heater-cathode volts, 90 max. Type 19J6 is used principally for renewal purposes.

TRIPLE DIODE—HIGH-MU TRIODE
Miniature type used as combined audio amplifier, AM detector, and FM detector in AM/FM receivers of the a/c or "transformerless" type. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 18.9; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6T8. Type 19T8 is used principally for renewal purposes.

TRIODE-PENTODE CONVERTER
Miniature type used as combined oscillator and mixer tube in "transformerless" AM/FM receivers. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 18.9; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6X8.
POWER TRIODE

Glass type used as output amplifier in dry-battery-operated receivers. Filament volts (dc), 3.3; amperes, 0.132. Characteristics as class A1 amplifier: plate volts, 135 max; grid volts, -22.5; plate ma., 6.5; plate resistance, 6300 ohms; amplification factor, 3.3; transconductance, 525 µmhos; load resistance, 8000 ohms; output mw., 110. This is a DISCONTINUED type listed for reference only.

SHARP-CUTOFF TETRODE

Glass type used as rf amplifier in dry-battery-operated receivers. Outline 46, OUTLINES SECTION. Filament volts (dc), 3.3; amperes, 0.132. Characteristics as class A1 amplifier: plate volts, 135 max; grid-No.2 (screen-grid) volts, 67.5 max; grid-No.1 volts, -1.5; plate ma., 3.7; grid-No.2 ma., 1.3; plate resistance, 325000 ohms; transconductance, 500 µmhos. This is a DISCONTINUED type listed for reference only.

SHARP-CUTOFF TETRODE

Glass type used as rf amplifier or biased detector in ac-operated receivers. Outline 46, OUTLINES SECTION. Tube requires five-contact socket. Heater volts (ac/dc), 2.5; amperes, 1.75. Typical operation and maximum ratings as class A1 amplifier: plate volts, 250 (275 max); grid-No.2 volts, 90; grid-No.1 volts, -3; plate resistance, 0.5 megohm; transconductance, 1050 µmhos; plate ma., 4; grid-No.2 ma., 1.7 max. This type is used principally for renewal purposes.

POWER PENTODE

Metal type 25A6 and glass octal type 25A6-GT used in output stage of ac/dc receivers. Outlines 6 and 22, respectively, OUTLINES SECTION. Tubes require octal socket. Heater volts (ac/dc), 25; amperes, 0.3. Maximum ratings as class A1 amplifier: plate volts, 150; grid-No.2 volts, 135; plate dissipation, 53 watts; grid-No.2 input, 1.9 watts. These are DISCONTINUED types listed for reference only.

RECTIFIER—POWER PENTODE

Glass octal type used as combined half-wave rectifier and power amplifier. Outline 22, OUTLINES SECTION. Heater volts (ac/dc), 25; amperes, 0.3. Typical operation of pentode unit as class A1 amplifier: plate volts and grid-No.2 volts, 100 (117 max); grid-No.1 volts, -15; plate ma., 26.5; grid-No.2 ma., 4; plate resistance, 90000 ohms, transconductance, 1800 µmhos; load resistance, 4500 ohms; output watts, 0.77. Maximum ratings of rectifier unit: peak inverse plate volts, 350; peak plate ma., 450; dc output ma., 75; peak heater-cathode volts, 175. This is a DISCONTINUED type listed for reference only.

HIGH-MU POWER TRIODE

Glass octal type used in output stage of ac/dc receivers. Outline 22, OUTLINES SECTION. Heater volts (ac/dc), 25; amperes, 0.3. Maximum ratings: plate volts, 180 max; plate dissipation, 10 max watts. This is a DISCONTINUED type listed for reference only.

294
HALF-WAVE VACUUM RECTIFIER

Glass octal type used as a damper tube in horizontal deflection circuits of television receivers. Outline 22, OUTLINES SECTION. This type may be supplied with pin No.1 omitted. Heater volts (ac/dc), 25; amperes, 0.3. Except for heater rating, this type is identical with glass octal type 6AX4-GT.

DIRECT-COUPLED POWER AMPLIFIER

Glass type used as class A1 power amplifier. One triode, the driver, is directly connected within the tube to the second, or output, triode. Heater volts (ac/dc), 25; amperes, 0.3. Maximum ratings and characteristics are the same as for type 25N6-G. Type 25B5 is a DISCONTINUED type listed for reference only.

POWER PENTODE

Glass octal type used in output stage of ac/dc receivers. Outline 42, OUTLINES SECTION. Heater volts (ac/dc), 25; amperes, 0.3. Typical operation as class A1 amplifier: plate volts, 200 max; grid-No.2 volts, 135 max; grid-No.1 volts, –23; plate ma., 62; grid-No.2 ma., 1.8; plate resistance, 18000 ohms; transconductance, 5000 μmhos; load resistance, 2500 ohms; output watts, 7.1. This is a DISCONTINUED type listed for reference only.

TRIODE—PENTODE

Glass octal type used as amplifier. High-mu triode unit and remote-cutoff pentode unit are independent. Outline 22, OUTLINES SECTION. Heater volts (ac/dc), 25; amperes, 0.15. Typical operation of pentode unit as class A1 amplifier: plate and grid-No.2 volts, 100; grid-No.1 volts, –3; plate ma., 7.6; grid-No.2 ma., 2; plate resistance, 18,500 ohms; transconductance, 2000 μmhos. Triode unit: plate volts, 100; grid volts, –1; plate ma., 0.6; amplification factor, 112; plate resistance, 75000; transconductance, 1500 μmhos. This is a DISCONTINUED type listed for reference only.

BEAM POWER TUBE

Glass octal types used as horizontal deflection amplifiers in circuits of television equipment. Outline 30, OUTLINES SECTION. These types may be supplied with pin No.1 omitted. Tubes require octal socket and may be mounted in any position. Heater volts (ac/dc), 25; amperes, 0.3. Except for heater rating, these types are identical with glass octal types 6BQ6-GT and 6BQ6-GB/T/6CU6, respectively. Type 25BQ6-GT is a DISCONTINUED type listed for reference only.

BEAM POWER TUBE

Miniature type used in the audio output stage of radio receivers. Because of its high power sensitivity and high efficiency at low plate and screen-grid voltages, it is capable of providing a relatively high power output. Outline 13, OUTLINES SECTION. Tube
requires miniature seven-contact socket and may be mounted in any position. Heater volts (ac/dc), 25; amperes, 0.3. Except for heater rating, this type is identical with miniature type 50C5.

**BEAM POWER TUBE**

**25C6-G**

Glass octal type used as output amplifier. Outline 42, OUTLINES SECTION. Heater volts (ac/dc), 25; amperes, 0.3. Refer to type 6Y6-G for typical operation as a class A amplifier. Type 25C6-G is a DISCONTINUED type listed for reference only.

**BEAM POWER TUBE**

**25CD6-GA**

**25CD6-GB**

Glass octal types used as horizontal deflection amplifiers in television receivers employing series-connected heater strings. Outlines 52 and 46, respectively, OUTLINES SECTION. Heater volts (ac/dc), 25; amperes, 0.6; warm-up time (average), 11 seconds. Peak heater-cathode volts, 200 max. When the heater is positive with respect to the cathode, the dc component of the heater-cathode voltage must not exceed 100 volts. Except for heater and heater-cathode ratings, these types are identical with glass octal types 6CD6-G and 6CD6-GA, respectively.

**BEAM POWER TUBE**

**25DN6**

Glass octal type used as horizontal deflection amplifier in television receivers employing series-connected heater strings. Outline 46, OUTLINES SECTION. Tube requires octal socket. Vertical tube mounting is preferred but horizontal operation is permissible if pins 1 and 3 are in vertical plane.

**HEATER VOLTAGE (AC/DC)** .................................................. 25 volts
**HEATER CURRENT** ................................................................. 0.6 amperes
**HEATER WARM-UP TIME (Average)** ........................................ 11 seconds
**TRANSCONDUCTANCE** ......................................................... 9000 \( \mu \)mhos
**Mu-Factor,† Grid No.2 to Grid No.1** ...................................... 4.35

† For plate and grid-No.2 volts, 125; grid-No.1 volts, —18; plate ma., 70; grid-No.2 ma., 6.3.

**HORIZONTAL DEFLECTION AMPLIFIER**

For operation in a 525-line, 30-frame system

**Maximum Ratings:**

- **DC PLATE VOLTAGE** .................................................. 700 max volts
- **PEAK POSITIVE-PULSE PLATE VOLTAGE (Absolute Maximum)** .................. 6600\(^{\circ}\) max volts
- **PEAK NEGATIVE-PULSE PLATE VOLTAGE** .................................. —1500 max volts
- **DC GRID-No.2 (SCREEN-GRID) VOLTAGE** ................................ 175 max volts
- **PEAK NEGATIVE-PULSE GRID-No.1 (CONTROL-GRID) VOLTAGE** ............... —200 max volts
- **PEAK CATHODE CURRENT** .................................................. 700 max ma
- **AVERAGE CATHODE CURRENT** ............................................ 200 max ma
- **GRID-No.2 INPUT** ............................................................. 3 max watts
- **PLATE DISSIPATION** .......................................................... 15 max watts
- **PEAK HEATER-CATHODE VOLTAGE:**
  - Heater negative with respect to cathode .................................. 200 max volts
  - Heater positive with respect to cathode .................................. 200\(^{\circ}\) max volts
- **BULB TEMPERATURE (At hottest point)** .................................... 225 max °C

**Maximum Circuit Value:**

- **Grid-No.1-Circuit Resistance** .......................................... 0.47 max megohm

\(^{\circ}\) The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

† Under no circumstances should this absolute value be exceeded.

\(^{\circ}\) An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

\(^{\circ}\) The dc component must not exceed 100 volts.
POWER PENTODE

Miniature type used in the audio output stage of radio and television receivers and in phonographs. Outline 13, OUTLINES SECTION. Heater volts (ac/dc), 25; amperes, 0.3. Except for heater rating, this type is identical with miniature type 6EH5.

25EH5

BEAM POWER TUBE

Metal type 25L6 and glass octal type 25L6-GT used in output stage of ac/dc receivers. Outlines 6 and 22, respectively, OUTLINES SECTION. These tubes require octal sockets and may be mounted in any position. Type 25L6-GT may be supplied with pin No.1 omitted. Heater volts (ac/dc), 25; amperes, 0.3. For maximum ratings and typical operation, refer to type 50L6-GT. Refer to miniature type 50C5 for curves, installation, and application information, but take into consideration the differences in heater ratings.

25L6
25L6-GT

DIRECT-COUPLED TWIN POWER AMPLIFIER

Glass octal type used as class A1 power amplifier. Heater volts (ac/dc), 25; amperes, 0.3. Characteristics as class A1 amplifier—input triode: plate volts, 100 (180 max); grid volts, 0; peak af grid volts, 29.7; plate ma., 5.8. Output triode: plate volts, 180 max; plate ma., 46; load resistance, 4000 ohms; output wats, 3.8. This is a DISCONTINUED type listed for reference only.

25N6-G

HALF-WAVE VACUUM RECTIFIER

Glass octal type used as damper diode in magnetic deflection circuit of television receivers and as a rectifier in conventional power-supply applications. Outline 22, OUTLINES SECTION. This type may be supplied with pin No.1 omitted. Heater volts (ac/dc), 25; amperes, 0.3. Except for heater rating and, in damper service, a peak inverse plate voltage rating of 2000 max volts and a peak heater-cathode voltage rating of 450 max volts with heater negative with respect to cathode, this type is identical with glass octal type 5W4-GT. Type 25W4-GT is used principally for renewal purposes.

25W4-GT

VACUUM RECTIFIER-DOUBLER

Glass type used as half-wave rectifier or voltage doubler in ac/dc receivers. Outline 34 or 35, OUTLINES SECTION. Heater volts (ac/dc), 25; amperes, 0.3. Maximum ratings: peak inverse plate volts, 700; peak plate ma. per plate, 450; peak heater-cathode volts, 350; dc output ma. per plate, 75. This is a DISCONTINUED type listed for reference only.

25Y5

VACUUM RECTIFIER-DOUBLER

Glass type used as half-wave rectifier or voltage doubler in ac/dc receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires six-contact socket and may be mounted in any position. Heater volts (ac/dc), 25; amperes, 0.3. This type is electrically identical with metal type 25Z6. Type 25Z5 is used principally for renewal purposes.

25Z5
VACUUM RECTIFIER-DOUBLER

Metal type 25Z6 and glass octal type 25Z6-GT used as half-wave rectifiers or voltage-doublers in ac/dc receivers. These types are used particularly in "transformerless" receivers of either the ac/dc type or the voltage-doubler type. Outlines 6 and 22, respectively, OUTLINES SECTION. Type 25Z6-GT may be supplied with pin No.1 omitted. Tubes require octal socket and may be mounted in any position. Type 25Z6 is a DISCONTINUED type listed for reference only.

Heater Voltage (AC/DC) ........................................... 25 volts

a In half-wave rectifier service, the two units may be used separately or in parallel.
† When a filter-input capacitor larger than 40 µf is used, it may be necessary to use more plate-supply impedance than the minimum value shown to limit the peak plate current to the rated value.

MEDIUM-MU TRIODE

Glass type used as rf voltage amplifier in ac-operated receivers. Outline 43, OUTLINES SECTION. Tube requires four-contact socket. Filament volts (ac/dc), 1.5; amperes, 1.05. Typical operation as class A: amplifier: plate volts, 180 max; grid volts, -14.5, plate ma., 6.2; plate resistance, 7300 ohms; transconductance, 1150 µmhos; amplification factor, 8.3. This is a DISCONTINUED type listed for reference only.

MEDIUM-MU TRIODE

Glass type used as voltage amplifier or detector in ac-operated receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires five-contact socket. Heater volts (ac/dc), 2.5; amperes, 1.75. Maximum ratings and characteristics as class A: amplifier: plate volts, 250 max; grid volts, -21; amplification factor, 9; plate resistance, 9250 ohms; transconductance, 975 µmhos; plate ma., 5.2. This type is used principally for renewal purposes.
MEDIUM-MU TRIODE
Glass type used as voltage amplifier or detector in battery-operated receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires four-contact socket. Filament volts (dc), 2.0; amperes, 0.06. Except for interelectrode capacitances, this type is electrically identical with glass-octal type 1H4-G. Type 30 is a DISCONTINUED type listed for reference only.

POWER TRIODE
Glass type used in output stage of battery-operated receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires four-contact socket. Filament volts (dc), 2.9; amperes, 0.13. Typical operation as class A1 amplifier: plate volts, 180 max; grid volts, –30; plate ma., 12.3; plate resistance, 3600 ohms; amplification factor, 3.8; transconductance, 1050 µmhos; load resistance, 5700 ohms; output watts, 0.375. This is a DISCONTINUED type listed for reference only.

SHARP-CUTOFF TETRODE
Glass type used as rf amplifier or biased detector in battery-operated receivers. Maximum over-all length, 5-1/32 inches; maximum diameter, 1-13/16 inches. Tube requires four-contact socket. Filament volts (dc), 2.0; amperes, 0.06. Typical operation as class A1 amplifier: plate volts, 180 max; grid-No.2 ma., 0.4 max; plate resistance, greater than 1 megohm; plate ma., 1.7; transconductance, 650 µmhos. This is a DISCONTINUED type listed for reference only.

RECTIFIER—BEAM POWER TUBE
Glass octal type used as combined half-wave rectifier and output amplifier in ac/dc receivers. Outline 23, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 52.5; amperes, 0.3. Maximum ratings for rectifier unit: ac plate volts (rms), 125; dc output ma., 60. Typical operation of beam power unit as class A1 amplifier: plate and grid-No.2 volts, 90; grid-No.1 volts, –7; plate ma., 27; grid-No.2 ma., 2; plate resistance, 17000 ohms; transconductance, 4800 µmhos; load resistance, 2600 ohms; maximum-signal output watts, 1.0. This is a DISCONTINUED type listed for reference only.

POWER PENTODE
Glass type used in output stage of battery-operated receivers. Outline 42, OUTLINES SECTION. Tube requires five-contact socket. Filament volts (dc), 2.0; amperes, 0.26. Typical operation as class A1 amplifier: plate and grid-No.2 volts, 180 max; grid-No.1 volts, –18; plate ma., 22; grid-No.2 ma., 5; plate resistance, 55000 ohms; transconductance, 1750 µmhos; load resistance, 6000 ohms; output watts, 1.4. This is a DISCONTINUED type listed for reference only.

REMOTE-CUTOFF PENTODE
Glass type used as rf or if amplifier in battery-operated radio receivers, particularly those employing a.v.c. Maximum over-all length, 5-1/32 inches; maximum diameter, 1-13/16 inches. Tube requires four-contact socket. Filament volts (dc), 2.0; amperes, 0.06. Characteristics as class A1 amplifier: plate volts, 180 max; grid-No.2 volts, 67.5 max; grid-No.1 volts, –3 min; plate ma., 2.8; grid-No.2 ma., 1.0; plate resistance, 1.0 megohm; transconductance, 620 µmhos. This is a DISCONTINUED type listed for reference only.
**REMOTE-CUTOFF TETRODE**

Glass type used as rf or if amplifier in ac receivers. Maximum over-all length, 5-1/32 inches; maximum diameter, 1-13/16 inches. Tube requires five-contact socket. Heater volts (ac/dc), 2.5; amperes, 1.75. Characteristics as class A1 amplifier: plate volts, 250 (275 max); grid-No.2 volts, 90 max; grid-No.1 volts, -3 min; plate ma., 6.5; grid-No.2 ma., 2.5; transconductance, 1050 μhos. This is a DISCONTINUED type listed for reference only.

**BEAM POWER TUBE**

Glass lock-in type used in output stage of ac/dc receivers. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 35; amperes, 0.15. For ratings and curves, refer to glass octal type 35L6-GT. Type 35A5 is used principally for renewal purposes.

**35A5**

**BEAM POWER TUBE**

Miniature type used in output stage of compact, ac/dcradio receivers. Because of its high power sensitivity at plate and screen-grid voltages available in ac/dc receivers, it is capable of providing a relatively high power output. Outline 18, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Within its maximum ratings, type 35B5 is equivalent in performance to glass-octal type 35L6-GT, and miniature type 35C5. Refer to type 35C5 for typical operation, maximum circuit values, installation, application information, and curves.

- **Heater Voltage (ac/dc)**: 35 volts
- **Heater Current**: 0.15 amperes
- **Direct Inter-electrode Capacitances (Approx.)**:
  - Grid No.1 to Plate: 0.7 μf
  - Grid No.1 to Cathode, Heater, Grid No.2, and Grid No.3: 12 μf
  - Plate to Cathode, Heater, Grid No.2, and Grid No.3: 9 μf

**CLASS A1 AMPLIFIER**

- **Maximum Ratings**:
  - Plate Voltage: 117 max volts
  - Grid-No.2 (screen-grid) Voltage: 4.5 max watts
  - Plate Dissipation: 1.0 max watt
  - Grid-No.2 Input: 
  - Peak Heater-Cathode Voltage:
    - Heater negative with respect to cathode: 150 max volts
    - Heater positive with respect to cathode: 150 max volts

**BEAM POWER TUBE**

Miniature type used in output stage of compact, ac/dcradio receivers. Because of its high power sensitivity and high efficiency at plate and screen-grid voltages available in ac/dc receivers, the 35C5 is capable of providing a relatively high power output. Except for terminal connections and slightly higher ratings, type 35C5 is equivalent in performance to miniature type 35B5 and, within its maximum ratings, to glass octal type 35L6-GT. The basing arrangement of the 35C5 simplifies the problem of meeting Underwriters' Laboratories requirements in the design of ac/dc receivers.

- **Heater Voltage (ac/dc)**: 35 volts
- **Heater Current**: 0.15 amperes
DIRECT INTERELECTRODE CAPACITANCES (Approx.):
Grid No.1 to Plate 0.7 μf
Grid No.1 to Cathode, Heater, Grid No.2, and Grid No.3 12 μf
Plate to Cathode, Heater, Grid No.2, and Grid No.3 9 μf

*PENTODE CONNECTION*

**INSTALLATION AND APPLICATION**

Type 35C5 requires miniature seven-contact socket and may be mounted in any position. Outline 18, OUTLINES SECTION. It is especially important that this tube, like other power-handling tubes, should be adequately ventilated.

The 35-volt heater is designed to operate under the normal conditions of line-voltage variation without materially affecting the performance or serviceability of the 35C5. For operation of the 35C5 in series with other types having 0.15-ampere rating, the current in the heater circuit should be adjusted to 0.15 ampere for the normal supply voltage.
In a series-heater circuit of the "dc power line" type employing several 0.15-ampere types and one or two 35C5's, the heater(s) of the 35C5('s) should be placed on the positive side of the line. Under these conditions, heater-cathode voltage of the 35C5 must not exceed the value given under maximum ratings. In a series-heater circuit of the "universal" type employing rectifier tube 35W4, one or two 35C5's and several 0.15-ampere types, it is recommended that the heater(s) of the 35C5('s) be placed in the circuit so that the higher values of heater-cathode bias will be impressed on the 35C5('s) rather than on the other 0.15-ampere types. This is accomplished by arranging the 35C5('s) on the side of the supply line which is connected to the cathode of the rectifier, i.e., the positive terminal of the rectified voltage supply. Between this side of the line and the 35C5('s), any necessary auxiliary resistance and the heater of the 35W4 are connected in series.

As a power amplifier (class A1), the 35C5 is recommended for use either singly or in push-pull combination in the power-output stage of "ac/dc" receivers. The operating values shown under typical operation have been determined on the basis that grid-No.1 current does not flow during any part of the input cycle.

**BEAM POWER TUBE**

Glass octal type used in output stage of ac/dc radio receivers. Outline 22, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. This type may be supplied with pin No.1 omitted. Refer to miniature type 35C5 for installation, application information, and curves.

**HALF-WAVE VACUUM RECTIFIER**

Miniature type used in power supply of ac/dc receivers. Equivalent in performance to glass-octal type 35Z5-GT. The heater is provided with a tap for operation of a panel lamp.

302
HEATER VOLTAGE (AC/DC):
  ENTIRE HEATER (PINS 3 AND 4) ........................................ 35
  PANEL LAMP SECTION (PINS 4 AND 6) .................................. 7.5
HEATER CURRENT:
  BETWEEN PINS 3 AND 4 .................................................. 0.15
  BETWEEN PINS 3 AND 6 .................................................. 0.15

* Without panel lamp.
** With No.40 or No.47 panel lamp.

HALF-WAVE RECTIFIER

Maximum Ratings:

PEAK INVERSE PLATE VOLTAGE ........................................... 330 max volts
PEAK PLATE CURRENT ................................................... 600 max ma
DC OUTPUT CURRENT:
  With Panel Lamp and No Shunting Resistor ......................... 60 max ma
  Without Panel Lamp .................................................. 90 max ma
  PANEL-LAMP-SECTION VOLTAGE (rms):
    When Panel Lamp Fails ............................................... 15 max volts
    PEAK HEATER-CATHODE VOLTAGE:
      Heater negative with respect to cathode ....................... 330 max volts
      Heater positive with respect to cathode ...................... 330 max volts

Typical Operation with Panel Lamp:*:

AC Plate-Supply Voltage (rms) ......................................... 117 volts
Filter-Input Capacitor ............................................... 40 \( \mu \)F
Minimum Total Effective Plate-Supply Impedance .................... 15 ohms
Panel-Lamp Shunting Resistor ...................................... 300 ohms
DC Output Current ................................................. 300 ma

Typical Operation without Panel Lamp:

AC Plate-Supply Voltage (rms) ......................................... 117 volts
Filter-Input Capacitor ............................................... 40 \( \mu \)F
Minimum Total Effective Plate-Supply Impedance .................... 15 ohms
DC Output Current ................................................. 100 ma
DC Output Voltage at Input to Filter (Approx.):
  At half-load current (50 ma) ...................................... 135 volts
  At full-load current (100 ma) .................................... 120 volts
Voltage Regulation (Approx.):
  Half-load to full-load current .................................. 15 volts

Maximum Circuit Values:

Panel-Lamp Shunting Resistor ...................................... 800 max ohms
  For dc output current of 80 ma .................................. 400 max ohms
  90 ma .................................................................. 250 max ohms

* Required when dc output current is greater than 60 milliamperes.

INSTALLATION AND APPLICATION

Tube requires miniature seven-contact socket and may be mounted in any position. Outline 13, OUTLINES SECTION. For heater considerations, refer to miniature type 35C5.

With the panel lamp connected as shown in the diagram, the drop across \( R \) and all heaters (with panel lamp) should equal 117 volts at 0.15 ampere. The shunting resistor \( R_s \) is required when dc output current exceeds 60 milliamperes. Values of \( R_s \) for dc output currents greater than 60 milliamperes are given in tabulated data.
HALF-WAVE VACUUM RECTIFIER

Glass lock-in type used in power supply of ac/dc receivers. The heater is provided with tap for the operation of a panel lamp. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 35; amperes, 0.15. For maximum ratings, refer to glass octal type 35Z5-GT. For typical operation and curves, refer to miniature type 35W4. Type 35Y4 is used principally for renewal purposes.

35Y4

HALF-WAVE VACUUM RECTIFIER

Glass lock-in type used in power supply of ac/dc receivers. Outline 22, OUTLINES SECTION. Tube requires octal socket. This type may be supplied with pin No.1 omitted. Heater volts (ac/dc), 35; amperes, 0.15. For maximum ratings and typical operation, refer to glass octal type 35Z5-GT without panel lamp. Type 35Z4-GT is used principally for renewal purposes.

35Z3

HALF-WAVE VACUUM RECTIFIER

Glass octal type used in power supply of ac/dc receivers. The heater is provided with a tap for operation of a panel lamp. Outline 22, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. This type may be supplied with pin No.1 omitted. For installation and application considerations, refer to miniature type 35W4.

Typical Operation with Panel Lamp:

| AC Plate-Supply Voltage (rms) | 117 volts |
| Filter-Input Capacitor | 40 μF |
| Minimum Total Effective Plate-Supply Impedance | 15 ohms |
| Panel-Lamp Shunting Resistor | 300 ohms |
| DC Output Current | 60 mA |

† No.40 or No.47 panel lamp used in circuit with capacitor-input filter given under type 35W4.
Technical Data

Typical Operation without Panel Lamp:
- AC Plate-Supply Voltage (rms) ........................................ 117 volts
- Filter-Input Capacitor .................................................. 40 μf
- Minimum Total Effective Plate-Supply Impedance ................. 15 ohms
- DC Output Current ...................................................... 100 mA
- DC Output Voltage at Input to Filter (Approx.):
  - At half-load current (50 ma.) ......................................... 140 volts
  - At full-load current (100 ma.) ................................. 120 volts
- Voltage Regulation (Approx.):
  - Half-load to full-load current .................................. 20 volts

Maximum Circuit Values:
- Panel-Lamp Shunting Resistor*:
  - For dc output current of 70 ma. .................................. 800 max ohms
  - 50 ma. ................................................................. 400 max ohms
  - 50 ma. ................................................................. 250 max ohms

* Required when dc output current is greater than 80 milliamperes.

SHARP-CUTOFF TETRODE
Glass type used as rf or if amplifier or as biased or grid-resistor detector in radio receivers. Outline 40, OUTLINES SECTION. Tube requires five-contact socket. Heater voltage (ac/dc), 6.3; amperes, 0.3. Characteristics as class A1 amplifier: plate volts, 250 max; grid-No.2 volts, 90 max; grid-No.1 volts, -3; plate ma., 3.2; grid-No.2 ma., 1.7 max; plate resistance, 0.55 megohm; transconductance, 1080 μmhos. This is a DISCONTINUED type listed for reference only.

MEDIUM-MU TRIODE
Glass type used as voltage amplifier or detector in radio receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires five-contact socket. Heater voltage (ac/dc), 6.3; amperes, 0.3. Characteristics as class A amplifier: plate and grid-No.2 volts, 250 max; grid-No.1 volts, -25; plate ma., 22; grid-No.2 ma., 3.8; plate resistance, 0.1 megohm; transconductance, 1200 μmhos; load resistance, 10000 ohms; output watts, 2.5. This is a DISCONTINUED type listed for reference only.

POWER PENTODE
Glass type used in output stage of radio receivers. Outline 40, OUTLINES SECTION. Tube requires five-contact socket. Heater voltage (ac/dc), 6.3; amperes, 0.3. Characteristics as class A amplifier: plate and grid-No.2 volts, 250 max; grid-No.1 volts, -3; plate ma., 5.8; grid-No.2 ma., 1.4; plate resistance, 1.0 megohm; transconductance, 1050 μmhos. This is a DISCONTINUED type listed for reference only.

REMOTE-CUTOFF PENTODE
Glass type used as rf or if amplifier in radio receivers, particularly those employing avc. Outline 40, OUTLINES SECTION. Tube requires five-contact socket. Heater voltage (ac/dc), 6.3; amperes, 0.3. Characteristics as class A amplifier: plate volts, 250 max; grid-No.2 volts, 90 max; grid-No.1 volts, -3 min; plate ma., 5.8; grid-No.2 ma., 1.4; plate resistance, 1.0 megohm; transconductance, 1050 μmhos. This is a DISCONTINUED type listed for reference only.

MEDIUM-MU TRIODE
Glass type used as resistance-coupled or impedance-coupled amplifier in battery-operated receivers. Outline 43, OUTLINES SECTION. Filament volts (dc), 5; amperes, 0.25. Characteristics as class A amplifier: plate-supply volts, 180; load resistance, 250000 ohms; grid volts, -3; plate ma., 0.2; plate resistance, 150000 ohms; amplification factor, 30; transconductance, 200 μmhos. This is a DISCONTINUED type listed for reference only.
POWER PENTODE

Glass type used in output stage of radio receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.4. This type is electrically identical with type 6K6-GT. Type 41 is used principally for renewal purposes.

POWER PENTODE

Glass type used in audio output stage of ac receivers. Outline 48, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.7. This type is electrically identical with type 6F6. Type 42 is used principally for renewal purposes.

POWER PENTODE

Glass type used in audio output stage of ac/dc receivers. Outline 43, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 25; amperes, 6.3. This type is electrically identical with type 25A6. Type 43 is used principally for renewal purposes.

POWER TRIODE

Glass type used in output stage of radio receivers. Outline 43, OUTLINES SECTION. Tube requires four-contact socket. Filament volts (ac/dc), 2.5; amperes, 1.5. Typical operation as class A1 amplifier: plate supply volts, 275 max; grid volts, -56; cathode-bias resistor, 1550 ohms; amplification factor, 3.5; plate resistance, 1700 ohms; transconductance, 2050 ohm/ma; plate ma., 36; load resistance, 4600 ohms; undistorted power output, 2 watts. This is a DISCONTINUED type listed for reference only.

HALF-WAVE VACUUM RECTIFIER

Miniature type used in power supply of small, portable, ac/dc/battery receivers where small size and low heat dissipation are important. Outline 11, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Heater volts (ac/dc), 45; amperes, 0.075. Maximum ratings: peak inverse plate volts, 350 max; peak plate ma., 390 max; de output ma., 65 max; peak heater-cathode volts, 175 max. Typical operation with capacitor-input filter; ac plate volts (rms), 117; minimum total effective plate-supply impedance, 15 ohms; de output ma., 65. This is a DISCONTINUED type listed for reference only.

HALF-WAVE VACUUM RECTIFIER

Glass octal type used in power supply of ac/dc receivers. The heater is provided with a tap for operation of a panel lamp. Outline 22, OUTLINES SECTION. Tube requires octal socket. Without panel lamp, heater volts (ac/dc) of entire heater (pins 2 and 7), 45; amperes, 0.15. With panel lamp, heater volts (ac/dc) of panel-lamp section (pins 2 and 3 with 0.15 ampere between pins 2 and 7), 5.5. Except for difference in heater voltage, this type has the same ratings and typical operation values as glass octal type 35Z5-GT. Type 45Z5-GT is a DISCONTINUED type listed for reference only.
DUAL-GRID POWER AMPLIFIER

Glass type used as class A, or class B amplifier in radio equipment. Outline 51, OUTLINES SECTION. Tube requires five-contact socket. Filament volts (ac/dc), 2.5; amperes, 1.75. Typical operation as class A amplifier: grid No.2 connected to plate at socket; plate volts, 250 max; grid volts, -39; plate ma., 22; plate resistance, 2300 ohms; amplification factor, 5.6; transconductance, 2350 μmhos; load resistance for maximum undistorted power output, 6400 ohms; output watts, 1.25. This is a DISCONTINUED type listed for reference only.

POWER PENTODE

Glass type used in audio output stage of radio receivers. Outline 51, OUTLINES SECTION. Tube requires five-contact socket and should preferably be mounted in vertical position. Horizontal operation is permissible if pins 1 and 5 are in vertical plane. Filament volts (ac/dc), 2.5; amperes, 1.75. Typical operation as class A amplifier: plate and grid-No.2 volts, 250 max; cathode-bias resistor, 450 ohms; plate ma., 31; grid-No.2 ma., 6; plate resistance, 60000 ohms; transconductance, 2500 μmhos; load resistance, 7000 ohms; power output, 2.7 watts. This type is used principally for renewal purposes.

POWER TETRODE

Glass type used in audio output stage of radio receivers designed to operate from dc power lines. Outline 51, OUTLINES SECTION. Heater volts (dc), 30; amperes, 0.4. Typical operation as class A amplifier: plate volts, 125 max; grid-No.2 volts, 100 max; grid-No.1 volts, -20; plate ma., 56; grid-No.2 ma., 9.6; transconductance, 3900 μmhos; load resistance, 1500 ohms; output watts, 2.5. This is a DISCONTINUED type listed for reference only.

DUAL-GRID POWER AMPLIFIER

Glass type used in output stage of battery-operated receivers. Outline 43, OUTLINES SECTION. Tube requires five-contact socket. Filament volts (dc), 2.0; amperes, 0.12. Typical operation as class A amplifier: grid No.2 connected to plate at socket; plate volts, 185 max; grid volts, -20; plate ma., 5; plate resistance, 4175 ohms; amplification factor, 4.7; transconductance, 1125 μmhos; load resistance, 11000 ohms; output watts (approx.), 0.17. This is a DISCONTINUED type listed for reference only.

POWER TRIODE

Glass type used in output stage of af amplifiers employing transformer input coupling. Maximum over-all length, 6-1/4 inches; maximum diameter, 2-7/16 inches. Tube requires four-contact socket and should be mounted in vertical position with base down. Filament volts (ac/dc), 7.5; amperes, 1.25. Characteristics as class A amplifier: plate volts, 450 max; grid volts, -84; cathode resistor, 1580 ohms; plate ma., 55; plate resistance, 1800 ohms; amplification factor, 3.6; transconductance, 2160 μmhos; load resistance, 4350 ohms; output watts, 4.6. This is a DISCONTINUED type listed for reference only.

BEAM POWER TUBE

Glass lock-in type used in output stage of ac/dc receivers. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 50; amperes, 0.15. For ratings and data, refer to glass-socket type 50L5-GT. Type 50A5 is used principally for renewal purposes.

50A5
BEAM POWER TUBE

50B5

Miniature type used in output stage of compact ac/dc receivers. Because of its high power sensitivity at plate and screen-grid voltages available in ac/dc receivers, it is capable of providing a relatively high power output. Outline 13, OUTLINES SECTION. Tube requires miniature seven-contact socket and may be mounted in any position. Except for basing arrangement, type 50B5 is identical with miniature type 50C5.

50C5

Miniature type used in output stage of compact, ac/dc radio receivers. Because of its high power sensitivity and high efficiency at plate and screen-grid voltages available in ac/dc receivers, the 50C5 is capable of providing a relatively high power output.

Within its maximum ratings, type 50C5 is equivalent in performance to glass octal type 50L6-GT. The basing arrangement of the 50C5 simplifies the problem of meeting Underwriters’ Laboratories requirements in the design of ac/dc receivers.

INSTALLATION AND APPLICATION

Type 50C5 requires miniature seven-contact socket and may be mounted in any position. Outline 13, OUTLINES SECTION. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

The 50-volt heater is designed to operate under the normal conditions of line-voltage variation without materially affecting the performance or serviceability of the 50C5. For operation of the 50C5 in series with other types having 0.15-ampere rating, the current in the heater circuit should be adjusted to 0.15 ampere for the normal supply voltage.

In a series-heater circuit of the "dc power line" type employing several 0.15-ampere types and one or two 50C5's, the heater(s) of the 50C5's should be placed on the positive side of the line. Under these conditions, heater-cathode voltage of the 50C5 must not exceed the value given under maximum ratings. In a series-heater circuit of the "universal" type employing rectifier tube 35W4, one or two 50C5's, and several 0.15-ampere types, it is recommended that the heater(s) of the 50C5's be placed in the circuit so that the higher values of heater-cathode bias will be impressed on the 50C5's rather than on the other 0.15-ampere types. This is accomplished by arranging the 50C5's on the side of the supply line which is connected to the cathode of the rectifier, i.e., the positive terminal of the rectified voltage supply. Between this side of the line and the 50C5's, any necessary auxiliary resistance and the heater of the 35W4 are connected in series.

As a power amplifier (class A), the 50C5 is recommended for use either singly or in push-pull combination in the power-output stage of "ac/dc" receivers. The operating values shown under typical operation have been determined on the basis that grid-No.1 current does not flow during any part of the input cycle.

**BEAM POWER TUBE**

Glass octal type used in output stage of ac/dc receivers. Outline 42, OUTLINES SECTION. Heater volts (ac/dc), 50; amperes, 0.15. Except for heater rating, this type is identical with glass octal type 6Y6-G. Type 50C6-G is a DISCONTINUED type listed for reference only.

**POWER PENTODE**

Miniature type used in the audio output stage of radio and television receivers and in phonographs. Outline 13, OUTLINES SECTION. Heater volts (ac/dc), 50; amperes, 0.15. Except for heater rating, this type is identical with miniature type 6EH5.
BEAM POWER TUBE

50L6-GT

Glass octal type used in output stage of ac/dc radio receivers. Outline 22, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. This type may be supplied with pin No.1 omitted. Refer to miniature type 50C5 for curves and installation and application information.

VACUUM RECTIFIER-DOUBLER

50X6

Lock-in type used as half-wave rectifier or voltage doubler in ac/dc receivers. Outline 20, OUTLINES SECTION. Tube requires lock-in socket. Heater volts (ac/dc), 50; amperes, 0.15. This type is electrically identical with glass octal type 50Y6-GT and, except for heater rating, with glass octal type 25Z6-GT. Refer to type 25Z6-GT for maximum ratings, typical operation, and curves. Type 50X6 is used principally for renewal purposes.

VACUUM RECTIFIER-DOUBLER

50Y6-GT

Glass octal type used as half-wave rectifier or voltage doubler in ac/dc receivers. This type is used particularly in “transformerless” receivers of either the ac/dc type or the voltage-doubler type. Outline 22, OUTLINES SECTION. This type may be supplied with pin No.1 omitted. Tube requires octal socket. Heater volts (ac/dc), 50; amperes, 0.15. Except for heater rating, this type is electrically identical with type 25Z6-GT.
VACUUM RECTIFIER-DOUBLER

Glass octal type used as half-wave rectifier or voltage doubler in ac/dc receivers. This type is used particularly in "transformerless" receivers of either the ac/dc type or the voltage doubler type. The heater is provided with a tap for operation of a panel lamp. Outline 22, OUTLINES SECTION. Tube requires octal socket. Without panel lamp, heater volts (ac/dc) of entire heater (pins 2 and 7), 50; amperes, 0.15. With panel lamp, heater volts (ac/dc) of panel-lamp section (pins 6 and 7 with 0.15 ampere between pins 2 and 7), 5.5. For maximum ratings and typical operation as half-wave rectifier or voltage doubler without panel lamp, refer to glass octal type 2Z56-GT. When operated with a panel lamp and 250-ohm panel-lamp shunting resistor, ratings and typical operation are the same as for type 2Z56-GT, except that dc output current per plate is 65 ma. Type 50Y7-GT is used principally for renewal purposes.

VACUUM RECTIFIER-DOUBLER

Glass octal type used as half-wave rectifier or voltage doubler in ac/dc receivers. Outline 36, OUTLINES SECTION. The heater is provided with a tap for operation of a panel lamp. Without panel lamp, heater volts (ac/dc) of entire heater (pins 2 and 7), 50; amperes, 0.15. With panel lamp, heater volts (ac/dc) of panel-lamp section (pins 6 and 7 with 0.15 ampere between pins 2 and 7), 2. Maximum ratings as rectifier or doubler: peak inverse plate volts, 700 max.; peak plate ma. per plate, 400 max.; dc output ma. per plate with panel lamp, 65 max.; peak heater-cathode volts, 350 max.; panel lamp section volts (pins 6 and 7), 2.5 max. This is a DISCONTINUED type listed for reference only.

HIGH-MU TWIN POWER TRIODE

Glass type used in output stage of ac-operated receivers as a class B power amplifier. Outline 43, OUTLINES SECTION. Tube requires medium seven-contact (0.856-inch pin-circle diameter) socket. Heater volts (ac/dc), 2.5; amperes, 2.0. Except for heater rating, this type is electrically identical with metal type 6N7. Type 53 is a DISCONTINUED type listed for reference only.

TWIN DIODE—MEDIUM-MU TRIODE

Glass type used as a combined detector, amplifier, and ave tube. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 2.5; amperes, 1.0. Except for heater rating, this type is electrically identical with glass type 85. Type 55 is a DISCONTINUED type listed for reference only.

MEDIUM-MU TRIODE

Glass type used as detector, amplifier, or oscillator in ac-operated receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires five-contact socket. Heater volts (ac/dc), 2.5; amperes, 1.0. Except for heater rating, this type is electrically identical with glass type 76. Type 56 is a DISCONTINUED type listed for reference only.

SHARP-CUTOFF PENTODE

Glass type used as biased detector in ac-operated receivers. Outline 45, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 2.5; amperes, 1.0. Except for heater rating and capacitances, this type is electrically identical with metal type 637. Type 57 is a DISCONTINUED type listed for reference only.

311
REMOTE-CUTOFF PENTODE

Glass type used in rf and if stages of radio receivers employing a-c and as a mixer in super-heterodyne circuits. Outline 45, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 2.5; amperes, 1.0. Except for heater ratings, this type is electrically identical with glass-socket type 6J7-G. Type 58 is a DISCONTINUED type listed for reference only.

TRIPLE-GRID POWER AMPLIFIER

Glass type used in audio output stage of ac-operated receivers. Outline 51, OUTLINES SECTION. Tube requires medium seven-contact (0.855-inch, pin-circle diameter) socket. Heater volts (ac/dc), 2.5; amperes, 2.0. Typical operation as class A1 amplifier (triode connection; grids No.2 and No.3 tied to plate); plate volts, 250 max; grid volts, −20; plate ma., 25; plate resistance, 2300 ohms; amplification factor, 6; transconductance, 2600; load resistance for maximum undistorted power output, 5000 ohms; undistorted output watts, 1.25. For typical operation as class A1 amplifier (pentode connection; grid No.3 tied to cathode at socket), refer to type 6F6 with plate voltage of 250 volts. Type 59 is a DISCONTINUED type listed for reference only.

RECTIFIER—BEAM POWER TUBE

70L7-GT

Glass octal type used as combined half-wave rectifier and output amplifier in ac/dc receivers. Outline 26, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 70; amperes, 0.15. Maximum ratings of rectifier unit: peak inverse plate volts, 350; peak plate ma., 420; dc output ma., 70; peak heater-cathode volts, 175; minimum total effective plate-supply impedance, 10 ohms. Typical operation and maximum ratings of beam power unit as class A1 amplifier: plate and grid-No.2 volts, 110 (117 ma); grid-No.1 volts, −7.5; plate ma., 40; grid-No.2 ma., 8; plate resistance, 15000 ohms; transconductance, 7500 µmhos; load resistance, 2000 ohms; output watts, 1.8; plate dissipation, 5 mas watts; grid-No.2 input, 1 max watt. This type is used principally for renewal purposes.

POWER TRIODE

71-A

Glass type used in output stage of audio-frequency amplifiers. Outline 48, OUTLINES SECTION. Tube requires four-contact socket. Filament volts (ac/dc), 5.0; amperes, 0.25. Characteristics as class A1 amplifier: plate volts, 180 mA; grid volts, −40.5; cathode resistor, 2150 ohms; plate ma., 20; plate resistance, 1750 ohms; amplification factor, 3; transconductance, 1700 µmhos; load resistance, 4800 ohms; undistorted output watts, 0.79. This is a DISCONTINUED type listed for reference only.

TWIN DIODE—HIGH-MU TRIODE

75

Glass type used as combined detector, amplifier, and a-c tube in radio receivers. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for interelectrode capacitances and plate volts of 250 max, this type is identical electrically with metal type 6SQT. Type 75 is used principally for renewal purposes.

MEDIUM-MU TRIODE

76

Glass type used as voltage amplifier or detector in radio receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires five-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Characteristics as class A1 amplifier: plate volts, 250 max; grid volts, −13.5; plate ma., 5; plate resistance, 9500 ohms; transconductance, 1450 µmhos. This is a DISCONTINUED type listed for reference only.
SHARP-CUTOFF PENTODE
Glass type used as biased detector or high-gain amplifier in radio receivers. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for capacitances and grid-No. 2 rating of 100 max volts, type 77 is electrically identical with metal type 6J7. Type 77 is a DISCONTINUED type listed for reference only.

REMOTE-CUTOFF PENTODE
Glass type used in rf and if stages of radio receivers, particularly those employing avc. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Except for capacitances, this type is identical electrically with metal type 6K7. Type 78 is used principally for renewal purposes.

HIGH-MU TWIN POWER TRIODE
Glass type used in output stage of radio receivers as a class B power amplifier or a class A1 driver. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.8. Maximum ratings and typical operation as class B power amplifier: plate volts, 250 max; grid volts, 6; zero-signal plate ma., 10.5; effective load resistance (plate-to-plate), 14000 ohms; output watts (approx.), 8; peak plate ma. per plate, 50 max; average plate dissipation, 11.5 watts max. This is a DISCONTINUED type listed for reference only.

FULL-WAVE VACUUM RECTIFIER
Glass type used in power supply of radio equipment having moderate direct-current requirements. Outline 43, OUTLINES SECTION. This type may also be made with a T-9 bulb. Tube requires four-contact socket and should be mounted preferably in a vertical position. Horizontal mounting is permissible if pins 1 and 4 are in a horizontal plane. Filament volts (ac), 5.0; amperes, 2.0. For filament operation, refer to type 5U4-G. Type 80 is electrically identical with glass octal type 5Y3-GT. Type 80 is used principally for renewal purposes.

HALF-WAVE VACUUM RECTIFIER
Glass type used in power supply of radio receivers. Maximum over-all length, 6-1/4 inches; maximum diameter, 2-7/16 inches. Tube requires four-contact socket. Filament volts (ac), 7.5; amperes, 1.25. Ratings as half-wave rectifier: peak inverse plate volts, 2000 max; peak plate ma., 500 max; de output ma., 85 max. This is a DISCONTINUED type listed for reference only.

FULL-WAVE MERCURY-VAPOR RECTIFIER
Glass type used to supply dc power of uniform voltage to receivers in which the rectified current requirements are subject to considerable variation. Outline 43, OUTLINES SECTION. Tube requires four-contact socket and should be mounted in vertical position with base down. Filament volts (ac), 2.5; amperes, 3. Maximum ratings for full-wave rectifier service: peak inverse plate volts, 1550 max; peak plate ma. per plate, 600; de output ma., 115 max; condensed-mercury temperature range, 24 to 60°C. This is a DISCONTINUED type listed for reference only.
FULL-WAVE VACUUM RECTIFIER

Glass type used in power supply of radio equipment having high dc requirements. Outline 43, OUTLINES SECTION. Tube requires four-contact socket. Heater volts (ac), 5.0; amperes, 2. This type is identical electrically with glass octal type 5V4-G. Type 83-v is a DISCONTINUED type listed for reference only.

FULL-WAVE VACUUM RECTIFIER

Glass type used in power supply of automobile and ac-operated radio receivers. Outline 34 or 35, OUTLINES SECTION. Tube requires five-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.5. Maximum ratings: peak inverse plate volts, 1250 max; peak plate ma., 180 max; dc output ma., 60 max; peak heater-cathode volts, 450 max. Typical operation with capacitor-input filter: ac plate-to-plate supply volts (rms), 650; minimum total effective plate-supply impedance per plate, 150 ohms; dc output ma., 60. Typical operation with choke-input filter: ac plate-to-plate supply volts (rms), 900; minimum filter-input choke, 10 henries; dc output ma., 60. This type is used principally for renewal purposes.

TWIN DIODE—MEDIUM-MU TRIODE

Glass type used as a combined detector, amplifier, and ave tube. Outline 40, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.3. Characteristics of triode unit as class A1 amplifier: plate volts, 250 max; grid volts, -20; amplification factor, 8.3; transconductance, 1100 µhos; plate ma., 8.0; plate resistance, 7500 ohms; load resistance, 20000 ohms; output watts, 9.35. This is a DISCONTINUED type listed for reference only.

TRIPLE-GRID POWER AMPLIFIER

Glass type used in output stage of radio receivers. Outline 35, OUTLINES SECTION. Tube requires six-contact socket. Heater volts (ac/dc), 6.3; amperes, 0.4. Maximum ratings as class B amplifier (triode connection): plate volts, 250 max; peak plate ma. per tube, 90 max; average grid input of grids No.1 and No.2 tied together, 0.35 max watt. This is a DISCONTINUED type listed for reference only.

V99

Glass types used as detector or amplifier in battery-operated receivers. Filament volts (dc), 3.0 to 3.3; amperes, 0.060 to 0.063. Characteristics as class A1 amplifier: plate volts, 90 max; grid volts, -4.5; amplification factor, 6.6; transconductance, 425 µhos; plate ma., 2.5. Operation as grid-resistor detector: plate volts, 45; grid resistor, 0.25 to 5 megohms; grid capacitor, 250 µfd; grid return to (+) filament. Operation as biased detector: plate volts, 90 max; grid volts, -10.5. These are DISCONTINUED types listed for reference only.

X99

DETECTOR AMPLIFIER TRIODE

DETECTOR AMPLIFIER TRIODE

Glass type used as detector or amplifier in battery-operated receivers. Outline 42, OUTLINES SECTION. Filament volts (dc), 5.0; amperes, 0.25. Operation as class A1 amplifier: plate volts, 180 max; grid volts, -13.5; amplification factor, 8.5; transconductance, 1800 µhos; plate ma., 7.7; load resistance, 10650 ohms; output watts, 0.285. Operation as biased detector: plate volts, 180; grid volts, -21. This is a DISCONTINUED type listed for reference only.

112-A
RECTIFIER—BEAM POWER TUBE

Glass octal type used as combined half-wave rectifier and output amplifier in ac/dc receivers. Outline 26, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 117; amperes, 0.09. For ratings and operation of rectifier unit, refer to type 117N7-GT. Typical operation of beam power unit as class A1 amplifier: plate and grid-No.2 volts, 105 (117 max); grid-No.1 volts, -5.2; peak af grid-No.1 volts, 5.2; grid-No.2 ma, 4 (zero-signal); 5.5 (maximum-signal); plate input, 6 max watts; grid-No.2 dissipation, 1 max watt; plate resistance (approx.), 17000 ohms; transconductance, 5900 amhos; load resistance, 4000 ohms; total harmonic distortion, 5 per cent; maximum-signal power output, 0.85 watt. Type 117L7/M7-GT is used principally for renewal purposes.

RECTIFIER—BEAM POWER TUBE

Glass octal type used as combined half-wave rectifier and output amplifier in ac/dc receivers. Outline 26, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 117; amperes, 0.09. Maximum ratings of rectifier unit as half-wave rectifier: peak inverse plate volts, 350 max; peak plate ma, 450 max; dc output ma, 76 max; peak heater-cathode volts (heater negative with respect to cathode), 175 max. Typical operation with capacitor-input filter: ac plate supply volts (rms), 177; minimum total effective plate-supply impedance, 15 ohms; dc output ma, 75; dc output volts as input to filter, 122. Typical operation of beam power unit as class A1 amplifier: plate and grid-No.2 volts, 100 (117 max); grid-No.1 volts, -6; peak af grid-No.1 volts, 6; plate ma, 51; grid-No.2 ma, 5; plate dissipation, 5.5 max watts; grid-No.2 input, 1 max watt; plate resistance (approx.), 16000 ohms; transconductance, 7000 amhos; load resistance, 3000 ohms; total harmonic distortion, 6 per cent; maximum-signal power output, 1.2 watts. This type is used principally for renewal purposes.

RECTIFIER—BEAM POWER TUBE

Glass octal type used as combined half-wave rectifier and output tube. Outline 26, OUTLINES SECTION. Tube requires octal socket. Heater volts (ac/dc), 117; amperes, 0.09. This type is electrically identical with glass-octal type 117L7/M7-GT. Type 117P7-GT is used principally for renewal purposes.

HALF-WAVE VACUUM RECTIFIER

Miniature type used in power supply of ac/dc/battery radio receivers. The heater is designed for operation directly across a 117-volt ac or dc supply line.

† When a filter-input capacitor larger than 40 µf is used, it may be necessary to use more plate-supply impedance than the minimum value shown to limit the peak plate current to the rated value.
INSTALLATION AND APPLICATION

Type 117Z3 requires miniature seven-contact socket and may be mounted in any position. Outline 13, OUTLINES SECTION. It is especially important that this tube, like other power-handling tubes, should be adequately ventilated.

Refer to the CIRCUITS SECTION for typical application of the 117Z3 as a half-wave rectifier in a portable 3-way superheterodyne receiver.

HALF-WAVE VACUUM RECTIFIER

Glass octal type used in power supply of ac/de; battery radio receivers. Maximum overall length, 3 inches; maximum diameter, 1-5/16 inches. Tube requires octal socket. Heater volts (ac/dc), 117; amperes, 0.04. Maximum ratings as half-wave rectifier: peak inverse plate volts, 350 max; peak plate ma., 540 max; peak heater-cathode volts, 175 max. Typical operation with capacitor-input filter: ac plate supply volts (rms), 117; minimum total effective plate-supply impedance, 30 ohms; dc output ma., 90. This is a DISCONTINUED type listed for reference only.

VACUUM RECTIFIER-DOUBLER

Glass octal type used as half-wave rectifier or voltage doubler in ac/de receivers. Outline 22, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position. This type may be supplied with pin No.1 omitted. Heater volts (ac/dc), 117; amperes, 0.075. Maximum ratings: peak inverse plate volts, 700 max; peak plate ma. per plate, 366 max; dc output ma. per plate, 60 max; peak heater-cathode volts, 350 max. Typical operation as half-wave rectifier with capacitor-input filter or as half-wave or full-wave voltage doubler: ac plate supply volts per plate (rms), 117; filter-input capacitor, 50 μf; minimum total effective plate-supply impedance per plate, 15 (30 for half-wave doubler service); dc output ma. per plate, 60. This type is used principally for renewal purposes.

POWER TRIODE

Glass type used in output stage of radio receivers. Outline 43, OUTLINES SECTION. Filament volts (ac/dc), 5.0; amperes, 1.25. Characteristics: plate volts, 250; grid volts, −60; plate ma., 39; amplification factor, 3; plate resistance, 1750 ohms; transconductance, 1700 μmhos; load resistance, 3000 ohms; output watts, 1.8. This is a DISCONTINUED type listed for reference only.

DETECTOR AMPLIFIER TRIODE

Glass type used as detector or class A amplifier in radio receivers. Outline 35, OUTLINES SECTION. Heater volts (ac/dc), 3; amperes, 1.25. Characteristics: plate volts, 180; grid volts, −9; amplification factor, 12.5; plate resistance, 8900 ohms; transconductance, 1400 μmhos; plate ma. 5.3. This is a DISCONTINUED type listed for reference only.
CURRENT REGULATORS

Constant-current regulating devices (ballast tubes) used in radio receivers. Bases fit the standard mogul screw socket and tubes may be mounted in any position. Tubes operate at high bulb temperature. They must be surrounded by a protective metal ventilating stack. Operating conditions: voltage range, 40 to 60 volts; ambient temperature, 150°F; operating current for the 876, 1.4 amperes; for the 886, 2.05 amperes. These are DISCONTINUED types listed for reference only.

SHARP-CUTOFF PENTODE

Miniature type used as audio amplifier in applications requiring reduced microphonics, leakage noise, and hum. Especially useful in the input stages of medium-gain public-address systems, home sound recorders, and general-purpose audio systems. Outline 12, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position. For operation as resistance-coupled amplifier, refer to Charts 16 and 17, RESISTANCE-COUPLED AMPLIFIER SECTION.

  - For cathode-bias operation: 0.5 max megohm
- Grid-No.2 connected to plate.

**BEAM POWER TUBE**

Miniature type used as power amplifier in compact high-fidelity audio equipment. Tube features linear operation over a wide range of power, high power sensitivity, high stability, and low heater power, and is capable of delivering high power output at low distortion. Double base-pin connections for both grid No.1 and grid No.2 provide cool operation of grids and thus minimize grid emission and permit use of high values of grid-circuit resistance to reduce driving power. Outline 14, OUTLINES SECTION. Tube requires miniature nine-contact socket and may be mounted in any position.

**HEATER VOLTAGE (AC/DC)**

- 6.3 volts

**HEATER CURRENT**

- 0.45 amperes

**DIRECT INTERELECTRODE CAPACITANCES:**

- Grid No.1 to Plate: 0.7 max µF
- Grid No.1 to Cathode, Heater, Grid No.2, and Grid No.3: 8 µF
- Plate to Cathode, Heater, Grid No.2, and Grid No.3: 8.5 µF

**Characteristics:**

**CLASS A1 AMPLIFIER**

- Plate Voltage: 250 volts
- Grid-No.2 (Screen-Grid) Voltage: 250 volts
- Grid-No.1 (Control-Grid) Voltage: 15 volts
- Plate Resistance (Approx.): 7300 ohms
- Transconductance: 4800 µhos
- Grid Current: 46 ma
- Grid-No.2 Current: 3.5 ma
- Grid-No.1 Voltage (Approx.) for plate current of 100 µa: -40 volts

**Maximum Ratings:**

**PUSH-PULL CLASS AB1 AMPLIFIER**

- Plate Voltage: 490 max volts
- Grid-No.2 Voltage: 390 max volts
- Plate Dissipation: 13 max watts
- Grid-No.2 Input: 2 max watts
- Peak Heater-Cathode Voltage:
  - Heater negative with respect to cathode: 200 max volts
  - Heater positive with respect to cathode: 200 max volts
- Bulb Temperature (At hottest point): 250 max °C

**Typical Operation (Values are for two tubes):**

* The dc component must not exceed 100 volts.
# Obtained from taps on the primary winding of the output transformer. The taps are located on each side of the center tap (B+) so as to apply 50 per cent of the plate signal voltage to grid No.2 of each output tube.

HIGH-MU TWIN TRIODE
Miniature type used as phase inverter or resistance-coupled amplifier in high-quality, high-fidelity audio amplifiers where low noise and hum are primary considerations. Outline 12, OUTLINES SECTION. This type is identical with miniature type 12AX7 except that it has a controlled equivalent noise and hum characteristic:

BEAM POWER TUBE
Glass octal type used in push-pull power amplifier circuits of high-fidelity audio equipment. Tube provides high power sensitivity and high stability and is capable of delivering high power output at low distortion. Double base-pin connections for both grid No.1 and grid No.2 provide for flexibility of circuit arrangement and also cool operation of the grids with the result that reverse grid current is minimized. Outline 41, OUTLINES SECTION. Tube requires octal socket and may be mounted in any position.

**NOTES**

Light face = Discontinued type.

1. = Glass rectangular.
2. = Glass round.
3. = Metal rectangular.
4. = Metal round.
5. = Clear glass.
6. = Filterglass.
7. = Frosted Filterglass.
8. = Magnetic.
11. = Spherical, unless otherwise specified.
12. = Cylindrical faceplate.
13. = At ullip l-terminal.
14. = At faceplate.
15. = This type has a flat, aluminized, Filterglass, phosphor-dot, screen plate.

**Black-and-White Types**

- ULTOR is defined as the electrode, or the electrode in combination with one or more additional electrodes connected within the tube to it, which is applied the highest de voltage for accelerating the electrons in the beam prior to its deflection.
- Grid No. 2 connected to final high-voltage electrode within tube.
- Referred to grid No. 1—Cathode-Drive Service.

For basing diagrams, see pages 332 and 333.

**Notes:** All picture tubes shown have 6.3-volt/0.6-milliamper heaters except types 9AP4 and 12AP4 which have 2.5-volt/2.1-milliamper heaters and types 14ATP4 and 17CDP4 which have 8.4-volt/450-milliamper heaters.

- Deflection factors (dc/in.) for typical operating conditions shown:
  - DI & DI5 (near screen) 180 to 240
  - DI5 & DI6 (near base) 150 to 294

Electron Tube Testing

The electron tube user—service man, experimenter, or non-technical radio listener—is interested in knowing the condition of his tubes, since they govern the performance of the device in which they are used. In order to determine the condition of a tube, some method of test is necessary. Because the operating capabilities and design features of a tube are indicated and described by its electrical characteristics, a tube is tested by measuring its characteristics and comparing them with values established as standard for that type. Tubes which read abnormally high with respect to the standard for the type are subject to criticism just the same as tubes which are too low.

Certain practical limitations are placed on the accuracy with which a tube test can be correlated with actual tube performance. These limitations make it impractical for the service man and dealer to employ complex and costly testing equipment having laboratory accuracy. Because the accuracy of the tube-testing device need be no greater than the accuracy of the correlation between test results and receiver performance, and since certain fundamental characteristics are virtually fixed by the manufacturing technique of leading tube manufacturers, it is possible to employ a relatively simple test in order to determine the serviceability of a tube.

In view of these factors, dealers and service men will find it economically expedient to obtain adequate accuracy and simplicity of operation by employing a device which indicates the status of a single characteristic. Whether the tube is satisfactory or unsatisfactory is judged from the test result of this single characteristic. Consequently, it is very desirable that the characteristic selected for the test be one which is truly representative of the tube's over-all condition.

The following information and circuits are given to describe and illustrate general theoretical and practical tube-tester considerations and not to provide information on the construction of a home-made tube tester. In addition to the problem of determining what tube characteristic is most representative of performance capabilities in all types of receivers, the designer of a home-made tester faces the difficult problem of determining satisfactory limits for his particular tester. The obtaining of information of this nature, if it is to be accurate and useful, is a tremendous job. It requires the testing of a large number of tubes of each type, testing of many types, and correlation of the data with performance in many kinds of equipment.

Short-Circuit Test

The fundamental circuit of a short-circuit tester is shown in Fig. 98. Although this circuit is suitable for tetrodes and types having less than four electrodes, tubes of more electrodes may be tested by adding more indicator lamps to the circuit. Voltages are applied between the various electrodes with lamps in series with the electrode leads. The value of the voltages applied will depend on the type of tube being tested. Any two shorted electrodes complete a circuit and light one or more lamps. Since two electrodes may be just touching to give a high-resistance short, it is desirable that the indicating lamps operate on very low current. It is also desirable to maintain the filament or heater of the tube at its operating temperature during the short-circuit test, because short-circuits in a tube may sometimes occur only when the electrodes are heated.

Selection of a Suitable Characteristic for Test

Some characteristics of a tube are far more important in determining its operating worth than are others. The cost of building a device to measure any one of the more important characteristics may be considerably higher than that of a device which measures a less representative characteristic. Consequently, three methods of test will be discussed, ranging from relatively simple and inexpensive equipment to more
elaborate, more accurate, and more costly devices.

An emission test is perhaps the simplest method of indicating a tube's condition. (Refer to Diodes, in ELECTRONS, ELECTRODES, AND ELECTRON TUBES SECTION, for a discussion of electron emission.) Since emission falls off as the tube wears out, low emission is indicative of the end of tube serviceability. However, the emission test is subject to limitations because it tests the tube under static conditions and does not take into account the actual operation of the tube. On the one hand, coated filaments, or cathodes, often develop active spots from which the emission is so great that the relatively small grid area adjacent to these spots cannot control the electron stream. Under these conditions, the total emission may indicate the tube to be normal although the tube is unsatisfactory. On the other hand, coated types of filaments are capable of such large emission that the tube will often operate satisfactorily after the emission has fallen far below the original value.

Fig. 99 shows the fundamental circuit diagram for an emission test. All of the electrodes of the tube, except the cathode, are connected to the plate. The filament, or heater, is operated at rated voltage; after the tube has reached constant temperature, a low positive voltage is applied to the plate and the electron emission is read on the meter. Readings which are well below the average for a particular tube type indicate that the total number of available electrons has been so reduced that the tube is no longer able to function properly.

A transconductance test takes into account a fundamental operating principle of the tube. (This fact will be seen from the definition of transconductance in the Section on ELECTRON TUBE CHARACTERISTICS). It follows that transconductance tests, when properly made, permit better correlation between test results and actual performance than does a straight emission test.

There are two forms of transconductance test which can be utilized in a tube tester. In the first form (illustrated by Fig. 100 giving a fundamental circuit with a tetrode under test), appropriate operating voltages are applied to the electrodes of the tube. A plate current depending upon the electrode voltages will then be indicated by the meter. If the bias on the grid is then shifted by the application of a different grid voltage, a new plate-current reading is obtained. The difference between the two plate-current readings is indicative of the transconductance of the tube. This method of transconductance testing is commonly called the “grid-shift” method, and depends on readings under static conditions. The fact that this form of test is made under static conditions imposes limitations not encountered in the second form of test made under dynamic conditions.

The dynamic transconductance test illustrated in Fig. 101 gives a fundamental circuit with a tetrode under test. This method is superior to the static transconductance test in that ac voltage is applied to the grid. Thus, the tube is tested under conditions which approximate actual operating conditions. The alternating component of the plate current is read by means of an ac ammeter of the dynamoscope type. The transconductance of the tube is equal to the ac plate current divided by the input-signal voltage. If a one-volt rms signal is applied to the grid, the plate-current-meter reading in milliamperes multi-
plied by one thousand is the value of transconductance in micromhos.

The power-output test probably gives the best correlation between test results and actual operating performance of a tube. In the case of voltage amplifiers, the power output is indicative of the amplification and output voltages obtainable from the tube. In the case of power-output tubes, the performance of the tube is closely checked. Consequently, although more complicated to set up, the power-output test will give closer correlation with actual performance than any other single test.

Fig. 102 shows the fundamental circuit of a power-output test for class A operation of tubes. The diagram illustrates the method for a pentode. The ac output voltage developed across the plate-load impedance (L) is indicated by the current meter. The current meter is isolated as far as the dc plate current is concerned by the capacitor (C). The power output can be calculated from the current reading and known load resistance. In this way, it is possible to determine the operating condition of the tube quite accurately.

Fig. 103 shows the fundamental circuit of a power-output test for class B operation of tubes. With ac voltage applied to the grid of the tube, the current in the plate circuit is read on a dc milliammeter. The power output of the tube is approximately equal to:

\[ \frac{P_o \times R_L}{0.405} \]

where \( P_o \) is the power output in watts, \( I_b \) is the dc current in amperes, and \( R_L \) is the load resistance in ohms.

**Essential Tube-Tester Requirements**

1. It is desirable that the tester provide for a short-circuit test to be made prior to measurement of the tube's characteristics.

2. It is important that some means of controlling the voltages applied to the electrodes of the tube be provided. If the tester is ac operated, a line-voltage control permits the supply of proper electrode voltages.

3. It is essential that the rated voltage applied to the filament or heater be maintained accurately.

4. It is suggested that the characteristics test follow one of the methods described. The method selected and the quality of the parts used in the test will depend upon the user's requirements.

**Tube-Tester Limitations**

A tube-testing device can only indicate the difference between a given tube's characteristics and those which are standard for that particular type. Since the operating conditions imposed upon a tube of a given type may vary within wide limits, it is impossible for a tube-testing device to evaluate tubes in terms of performance capabilities for all applications. The tube tester, therefore, cannot be looked upon as a final authority in determining whether or not a tube is always satisfactory. Actual operating test in the equipment in which the tube is to be used will give the best possible indication of a tube's worth.
Resistance-Coupled Amplifiers

Resistance-coupled, audio-frequency voltage amplifiers utilize simple components and are capable of providing essentially uniform amplification over a relatively wide frequency range.

Suitable Tubes

In this section, data are given for over 50 types of tubes suitable for use in resistance-coupled circuits. These types include low- and high-mu triodes, twin triodes, triode-connected pentodes, and pentodes. The accompanying key to tube types will assist in locating the appropriate data chart.

Circuit Advantages

For most of the types shown, the data pertain to operation with cathode bias; for all of the pentodes, the data pertain to operation with series screen-grid resistor. The use of a cathode-bias resistor where feasible and a series screen-grid resistor where applicable offer several advantages over fixed-voltage operation.

The advantages are: (1) effects of possible tube differences are minimized; (2) operation over a wide range of plate-supply voltages without appreciable change in gain is feasible; (3) the low frequency at which the amplifier cuts off is easily changed; and (4) tendency toward motorboating is minimized.

Number of Stages

These advantages can be enhanced by the addition of suitable decoupling filters in the plate supply of each stage of a multi-stage amplifier. With proper filters, three or more amplifier stages can be operated from a single power-supply unit of conventional design without encountering any difficulties due to coupling through the power unit. When decoupling filters are not used, not more than two stages should be operated from a single power-supply unit.

KEY TO CHARTS
Symbols Used in Resistance-Coupled Amplifier Charts

C = Blocking Capacitor (μF).
Ck = Cathode Bypass Capacitor (μF).
Ck1 = Screen-Grid Bypass Capacitor (μF).
Ebb = Plate-Supply Voltage (volts).
Voltage at plate equals plate-supply voltage minus drop in Rp and Rk. See Note 1 below.
Rk = Cathode Resistor (ohms).
Rk1 = Screen-Grid Resistor (megohms).
Rg = Grid Resistor (megohms) for following stage.
Rp = Plate Resistor (megohms).
V.G. = Voltage Gain. At 5 volts (rms) output unless otherwise specified.
Eo = Peak Output Voltage (volts).
This voltage is obtained across Rk (for following stage) at any frequency within the flat region of the output vs. frequency curve, and is for the condition where the signal level is adequate to swing the grid of the resistance-coupled amplifier tube to the point where its grid starts to draw current.

Note 1: For other supply voltages differing by as much as 50 per cent from those listed, the values of resistors, capacitors, and voltage gain are approximately correct. The value of voltage output, however, for any of these other supply voltages, equals the listed voltage output multiplied by the new plate-supply voltage divided by the plate-supply voltage corresponding to the listed voltage output.

General Circuit Considerations

In the discussions which follow, the frequency (f2) is that value at which the high-frequency response begins to fall off. The frequency (f1) is that value at which the low-frequency response drops below a satisfactory value, as discussed below. Decoupling filters are not necessary for two stages or less. A variation of 10 per cent in values of resistors and capacitors has only slight effect on performance. One-half-watt resistors are usually suitable for Rk1, Rg, Rp, and Rk resistors. Capacitors C and Ck1 should have a working voltage equal to or greater than Ebb. Capacitor Ck may have a low working voltage in the order of 10 to 25 volts. Peak Input Voltage is equal to the Peak Output Voltage divided by the Voltage Gain.

Triode Amplifier
Heater-Cathode Type

Capacitors C and Ck have been chosen to give an output voltage equal to 0.8 Eo for a frequency (f1) of 100 cycles. For any other value of f1, multiply values of C and Ck by 100/f1. In the case of capacitor Ck, the values shown in the charts are for an amplifier with dc heater excitation; when ac is used, depending on the character of the associated circuit, the gain, and the value of f1, it may be necessary to increase the value of Ck to minimize hum disturbances. It may be desirable to operate the heater at a positive voltage of from 15 to 40 volts with respect to the cathode. The voltage output at f1 of "n" like stages equals (0.8)n × Eo where Eo is the peak output voltage of final stage. For an amplifier of typical construction, the value of f2 is well above the audio-frequency range for any value of Rn.

Pentode Amplifier
Filament-Type

Capacitors C and Ck1 have been chosen to give an output voltage equal to 0.8 × Eo for a frequency (f1) of 100 cycles. For any other value of f1, multiply values of C and Ck1 by 100/f1. The voltage output at f1 for "n" like stages equals (0.8)n × Eo where Eo is peak out-
put voltage of final stage. For an amplifier of typical construction, and for $R_p$ values of 0.1, 0.25, and 0.5 megohms, approximate values of $f_1$ are 20000, 10000, and 5000 cps, respectively. Note: The values of input-coupling capacitor in microfarads and of grid resistor in megohms should be such that their product lies between 0.02 and 0.1. Values commonly used are 0.005 µf and 10 megohms.

**Pentode Amplifier**

**Heater-Cathode Type**

Capacitors $C$, $C_k$, and $C_{g2}$ have been chosen to give an output voltage equal to $0.7 \times E_0$ for a frequency ($f_1$) of 100 cycles. For any other value of $f_1$, multiply values of $C$, $C_k$, and $C_{g2}$ by $100/f_1$. In the case of capacitor $C_k$, the values shown in the charts are for an amplifier with dc heater excitation; when ac is used, depending on the character of the associated circuits, the voltage gain, and the value of $f_1$, it may be necessary to increase the value of $C_k$ to minimize hum disturbances. It may be desirable to operate the heater at a positive voltage of from 15 to 40 volts with respect to the cathode. The voltage output at $f_1$ for "n" like stages equals $(0.7)^n \times E_0$ where $E_0$ is peak output voltage of final stage. For an amplifier of typical construction, and for $R_p$ values of 0.1, 0.25, and 0.5 megohms, approximate values of $f_1$ are 20000, 10000, and 5000 cps, respectively.

**Phase Inverters**

Information given for triode amplifiers, in general, applies to this case. Capacitors $C$ have been chosen to give an output voltage equal to $0.9 \times E_0$ for a frequency ($f_1$) of 100 cycles. For any other value of $f_1$, multiply values of $C$ by $100/f_1$. The signal input is applied to the grid of triode unit A. Grid of triode unit B obtains its signal from a tap (P) on the grid resistor ($R_g$) in the output circuit of unit A. The tap is chosen so as to make the voltage output of unit B equal to that of unit A. Its location is determined by the voltage gain values given in the charts. For example, if V.G. is 20 (from the charts), P is chosen so as to supply 1/20 of the voltage across $R_g$ to the grid of unit B. For phase-inverter service, the cathode resistor may be left unbypassed unless a bypass capacitor is necessary to minimize hum; omission of the bypass capacitor assists in balancing the output stages. The value of $R_k$ is specified on the basis that both units are operating simultaneously at the same values of plate load and plate voltage.

**See Circuit Diagram 2**

*All values measured at 1 volt (rms) output and grid-No. 1 bias of 1 volt.*

*All values measured at 2 volts (rms) output.*

*Coupling capacitors should be selected to give desired frequency response. Cathode resistors should be adequately bypassed.*
Circuits

The circuits shown in the following pages are included in this Manual to illustrate some of the more important applications of RCA receiving tubes; they are not necessarily examples of commercial practice. These circuits have been conservatively designed and are capable of excellent performance. Electrical specifications are given for circuit components to assist those interested in home construction. Layouts and mechanical details are omitted because they vary widely with the requirements of individual set builders and with the sizes and shapes of the components employed.

Performance of these circuits depends as much on the quality of the components selected and the care employed in layout and construction as on the circuits themselves. Good signal reproduction from receivers and amplifiers requires the use of good-quality speakers, transformers, chokes, and input sources (microphones, phonograph pickups, etc).

Coils for the receiver circuits may be purchased at local parts dealers by specifying the characteristics required: for rf coils, the circuit position (antenna or interstage), tuning range desired, and tuning capacitances employed; for if coils or transformers, the intermediate frequency, circuit position (1st if, 2nd if, etc.), and, in some cases, the associated tube types; for oscillator coils, the receiver tuning range, intermediate frequency, type of converter tube, and type of winding (tapped or transformer-coupled).

The voltage ratings specified for capacitors are the minimum dc working voltages required. Paper, mica, or ceramic capacitors having higher voltage ratings than those specified may be used except insofar as the physical sizes of such capacitors may affect equipment layout. However, if electrolytic capacitors having substantially higher voltage ratings than those specified are used, they may not “form” completely at the operating voltage, with the result that the effective capacitances of such units may be below their rated value. The wattage ratings specified for resistors assume methods of construction that provide adequate ventilation; compact installations having poor ventilation may require resistors of higher wattage ratings.

Information on the characteristics and application features of each tube will be found in the TUBE TYPES SECTION. This information will prove of assistance in understanding and utilizing the circuits.

The following circuits will be found in the subsequent pages:

T4=Output transformer for matching impedance of voice coil to 2500-ohm tube load
AUTOMOBILE RECEIVER

NOTE: This circuit may be readily adapted for operation from a 12.6-volt dc source by the choice of a suitable vibrator and vibrator transformer, and by the substitution of the following RCA tube types for those shown in the diagram: RF AMPLIFIER, 12BA6; CONVERTER, 12BE6; IF AMPLIFIER, 12BA6; DIODE DETECTOR, AVC, AUDIO AMPLIFIER, 12AV6; POWER AMPLIFIER, 12A6; RECTIFIER, 12X4. Recommendations as to suitable vibrators and vibrator transformers may be obtained from manufacturers of these components. For 12.6-volt operation the voltage rating of $C_4$ and $C_5$ should be increased to 100 volts.
144-Mc SUPERREGENERATIVE RECEIVER

C₄₆ = 250 µf, ceramic or mica, 200 v.
C₄₇ = 0.1 µf, paper, 200 v.
C₅₀ = 500 µf, ceramic or mica, 400 v.
L₁ = 1 turn of No. 14 Enam. wound on a 3/8” diam. coil form
L₄ = 2.5 turns of No. 14 Enam. spaced 1 wire diameter wound
on same form as L₁ with end spaced 3/4”
from L₁.
L₅₄, L₅₅, L₅₆, L₅₇ = Choke, 1
µh (approx.), 25 turns of
No. 24 Enam. close-wound
on resistor (47000 ohms, 0.5
watt), connected in parallel
with resistor.
L₆₄ = 2.5 turns of No. 14 Enam.
spaced 1 wire diameter,
wound on 3/4” form.
L₆₅ = 2 turns of No. 14 Enam.
spaced 1 wire diameter,
wound on 3/4” form, tapped
at 1/2 turn from ground end.
L₇₅ = Choke, 2.5 mh. (may not
be required: follow trans-
former manufacturer’s recom-
mendation)
R₁₁, R₁₂, R₁₃, R₁₄ = 120 ohms, 0.5
watt.
R₂₁, R₂₂, R₂₃ = 39000 ohms, 0.5 watt.
R₃₁, R₃₂, R₃₃, R₃₄ = 47000 ohms, 0.5
watt.
R₄₁, R₄₂, R₄₃ = 1000000 ohms, 0.5
watt.
R₅₁ = 47 ohms, 0.5 watt.
R₆₁ = 35000 ohms, 1 watt.
R₇₁, R₇₂ = 47000 ohms, 0.5 watt.
R₈₁, R₈₂, R₈₃ = 47000 ohms, 1 watt.
R₉₁, R₉₂, R₉₃ = 2200000 ohms, 0.5
watt.
R₁₀₁, R₁₀₂, R₁₀₃ = 56 ohms, 0.5 watt.
R₁₁₁, R₁₁₂, R₁₁₃, R₁₁₄ = Volume controls,
potentiometers, 1 megohm.
R₁₂₁ = 150000 ohms, 0.5 watt.
R₁₃₁ = 8200 ohms, 0.5 watt.
R₁₄₁ = 560 ohms, 0.5 watt.
R₁₅₁ = 2.2 megohms, 0.5 watt.
R₁₆₁, R₁₆₂ = 100000 ohms, 0.5 watt.
R₁₇₁, R₁₇₂ = 150000 ohms, 1 watt.
T₁, T₂, T₃ = Intermediate-frequency
transformers, 10.7 Mc.
T₄ = Ratio-detector transformer,
10.7 Mc.
T₅ = Discriminator transformer,
10.7 Mc.

NOTE: A high-frequency de-emphasis network having a time constant of 75 microseconds (such as that formed by R₂₀ and C₄₇) should be inserted between R₃₄ and C₄₇ in the discriminator output lead.

Fig. 19-9 illustrates a circuit for an FM broadcast tuner. The basic circuit has been arranged to show the use of a ratio detector, but the limiter/discriminator circuit shown in the lower right-hand corner of the diagram can be substituted as indicated at points X, Y, and Z in the schematic.

A word of caution is necessary in connection with this circuit. Because it works at very high frequencies and is required to handle a very wide bandwidth, its construction requires more than ordinary skill and experience. Placement of component parts is quite critical and may require considerable experimentation. All rf leads to components including bypass capacitors must be kept short and must be properly dressed to minimize undesirable coupling and capacitance effects. Correct circuit alignment and oscillator tracking require the use of a cathode-ray oscilloscope, a high-impedance vacuum-tube voltmeter, and a signal generator capable of supplying a frequency-modulated signal on 10.7 Mc as well as accurate marker signals in the 88-108-Mc band. Unless the builder has the necessary equipment and has had considerable experience with broad-band, high-frequency circuits, he should not undertake the construction of this circuit.

- $R_{27} = 270000 \, \Omega$, 0.5 watt
- $R_{28} = 470000 \, \Omega$, 0.5 watt
- $R_{29} = 100000 \, \Omega$, 0.5 watt
NON-MOTORBOATING RESISTANCE-COUPLED AMPLIFIER
Voltage Gain, 9000

C1, C2 = 8 μf, electrolytic, 25 v.
C3, C4 = 0.06 μf, paper, voltage rating as high as supply voltage
C5, C6 = 0.006 μf, paper, voltage rating as high as supply voltage

R1 = Volume control, potentiometer
R2, R4 = 600 ohms, 0.5 watt
R3 = 560000 ohms, 0.5 watt

R4, R5 = 100000 ohms, 0.5 watt
R6 = Volume control, potentiometer, 0.5 megohm, ganged with R1
F = Decoupling filter

NOTE: Values of resistance and capacitance shown in this circuit are taken from Charts 11 and 14 in the RESISTANCE-COUPLED AMPLIFIER SECTION. The values are chosen to give a sharp low-frequency cutoff and, thus, to minimize tendency of multiple stages to motorboat. Operation of three or more stages, including power stage, from a common B supply may make it necessary to use a decoupling filter in the plate-supply lead of one or more of the voltage amplifier stages. The constants of decoupling filters depend on the design requirements of the amplifier.

CODE-PRACTICE OSCILLATOR

C1, C2 = 0.001 μf, mica, 300 v.
C3 = 0.01 μf, paper, 400 v.
C4 = 0.002 μf, mica, 300 v.
C5 = 0.003 μf, paper, 400 v.
C6 = 20 μf, electrolytic, 250 v.

R1 = 27000 ohms, 0.5 watt
R1 = 270000 ohms, 0.5 watt
R2 = 22000 ohms, 0.5 watt
R4 = Pitch-control, potentiometer, 1.0 megohm
R5 = Volume control, potentiometer, 100000 ohms
R6 = 2.2 megohms, 0.5 watt
R7 = 470000 ohms, 0.5 watt
R8 = 470 ohms, 25 watts

NOTES: (1) The point marked "GROUND AC RETURN" should be connected to a cold-water pipe or other conductor providing a direct, low-resistance return to ground.
(2) High-impedance (2000 ohms or more) headphones are required.
(3) RCA miniature types 12AV6 and 35W4 may be substituted for the 12SQ7 and 35Z5-GT respectively without affecting performance of the circuit.
INTERCOMMUNICATION SET
With Master Unit and Two or More Remote Units

C1, C2 = 0.0022 µf, paper, 200 v.
C3 = 0.005 µf, paper, 200 v.
C4, C5 = 60 µf, electrolytic, 150 v.
F = Fuse, 1 ampere
R1 = Volume control, potentiometer, 500000 ohms, audio taper
R2 = 6.8 megohms, 0.5 watt
R3 R4 = 470000 ohms, 0.5 watt
R5 = 10000 ohms, 0.5 watt
R6 R7 = 68 ohms, 0.5 watt
R8 = 2500 ohms, 1 watt
S1, S2, S3 = Speaker, permanent-magnet, voice-coil impedance 3-4 ohms
SW1 = On-off switch, single-pole single-throw, attached to volume control R1
SW2 = Talk-listen switch, four-pole double-throw
SW3 = Station-selector switch, rotary
T1 = Input transformer, 4-ohm primary, 25000-ohm secondary
T2 = Output transformer, 3000-ohm primary, 4-ohm secondary
T3 = Power transformer, 125 volts rms, 50 ma., 6.3 volts rms, 2 amperes

Notes: The leads from the LISTEN-TALK switch to T1 and T2 should be kept as far apart as possible to prevent undesirable regeneration effects.
Connections to the remote speaker units should be made with low-resistance wire, preferably shielded "intercom" cable.
In the diagram the FUNCTION-SELECTOR SWITCH (S₁) and RANGE-SELECTOR SWITCH (S₂) are shown in their maximum counterclockwise positions (S₁ = "OFF"; S₂ = "3 VOLTS, R × 1")

NOTE: This electronic volt-ohm meter circuit, similar to those used in RCA VoltOhmystat, is included here solely to illustrate a particular application of RCA Receiving Tubes. It is not recommended for home construction because of the large number of special components required, and because laboratory-type test equipment and reference standards are necessary for proper checking and calibration of the various functions and ranges.

RCA Technical Publications

on Tubes, Semiconductor Devices, Electronic Components, Batteries, and Test and Measuring Equipment

Copies of the publications listed below may be obtained from your RCA distributor or from Commercial Engineering, Radio Corporation of America, Harrison, N. J.

Electron Tubes

- RCA TUBE HANDBOOK—HB-3 (7\(\frac{1}{8}\)" x 5\(\frac{1}{4}\)""). Five deluxe 2-inch-capacity binders imprinted in gold. The bible of the industry—contains over 3400 pages of loose-leaf data and curves on RCA receiving tubes, picture tubes, cathode-ray tubes, phototubes, transmitting tubes, special tubes, and semiconductor devices. Available on subscription basis. Price $17.50* including service for first year. Write to Commercial Engineering for descriptive folder and order form.

- RCA RECEIVING TUBE MANUAL—RC-19 (8\(\frac{1}{4}\)" x 5\(\frac{1}{8}\)"")—364 pages. Revised, expanded, and brought up to date. Contains technical data on more than 625 receiving tubes, including types for black-and-white and color television and series-string applications. Features tube theory written for the layman, application data for radio and television circuits, Resistance-Coupled Amplifier Section, and several circuits for high-fidelity audio amplifiers. Features lie-flat binding. Price 75 cents.*

- RADIOTRON† DESIGNER'S HANDBOOK—4th Edition (8\(\frac{1}{4}\)" x 5\(\frac{1}{2}\)"")—1500 pages. Comprehensive reference thoroughly covering the design of radio and audio circuits and equipment. Written for the design engineer, student, and experimenter. Contains 1000 illustrations, 2500 references, and cross-referenced index of 7000 entries. Edited by F. Langford-Smith of Amalgamated Wireless Valve Co., Pty., Ltd. in Australia. Price $7.00.*

- RCA TRANSMITTING TUBES—TT-4 (8\(\frac{3}{8}\)" x 5\(\frac{1}{8}\)"")—266 pages. Contains basic information on generic tube types, on tube parts and materials, on tube installation and application, and on interpretation of tube data. Includes maximum ratings, typical operating values, and characteristics curves for power tubes having plate-input ratings up to 4 kilowatts, and maximum ratings and operating values for associated rectifier tubes. Contains sections on transmitter-design considerations and on rectifier circuits and filters. Features classification charts for quick, easy selection of tubes, and circuit diagrams for transmitting and industrial applications. Features lie-flat binding. Price $1.00.*

- RCA POWER AND GAS TUBES—PG-101C (10\(\frac{3}{4}\)" x 8\(\frac{3}{16}\)"")—24 pages. Completely revised and brought up to date. Technical information on 174 RCA vacuum power tubes, rectifier tubes, thyatrons, ignitrons, magnetrons, and vacuum-gauge tubes. Includes terminal connections. Price 20 cents.*

- RCA RECEIVING-TYPE TUBES FOR INDUSTRY AND COMMUNICATIONS—RIT-104A (10\(\frac{3}{16}\)" x 8\(\frac{3}{16}\)"")—24 pages. Technical information on 150 RCA "special red" tubes, premium tubes, computer tubes, pencil tubes, glow-discharge tubes, small thyatrons, low-microphonic amplifier tubes, and other special types. Includes socket-connection diagrams. Price 25 cents.*

- RCA RECEIVING TUBES FOR AM, FM, AND TELEVISION BROADCAST—1275-H (10\(\frac{1}{8}\)" x 8\(\frac{3}{16}\)"")—36 pages. New booklet contains classification chart, characteristics chart, and base and envelope connection diagrams on more than 700 entertainment receiving tubes and picture tubes. Price 25 cents.*

- TECHNICAL BULLETINS—Authorized information on RCA transmitting tubes and other tubes for communications and industry. Be sure to mention tube-type bulletin desired. Single copy on any type free on request.

- RCA PREFERRED TYPES LIST—PTL-501F (10\(\frac{3}{4}\)" x 8\(\frac{3}{16}\)"")—4 pages. Lists RCA Preferred Tube Types, both receiving

*Prices shown apply in U.S.A. and are subject to change without notice.
and non-receiving, by function. An aid to equipment designers in the selection of tube types for new equipment design. Single copy free on request.

- **RCA PHOTOSensitive Devices and Cathode-Ray Tubes**—CRPD-105A (10\%^\circ" x 8\%^\circ")—32 pages. Contains technical information on 134 RCA tubes including single-unit, twin-unit, and multiplier phototubes; camera and image-converter tubes; flying-spot tubes; monitor, projection, transcriber, and view-finder kinescopes; oscillograph and storage tubes. Price 30 cents.*

- **Headliners for Hams**—HAM-103B (10\%^\circ" x 8\%^\circ")—4 pages. Technical information and terminal-connection diagrams for 48 RCA “HAM” Preference Types: modulators, class C amplifiers and oscillators, frequency multipliers, rectifier tubes, thyratrons, glow-discharge (cold-cathode) tubes, and cathode-ray tubes. Single copy free on request.

- **RCA Interchangeability Directory of Industrial-Type Electron Tubes**—ID-1020A (10\%^\circ" x 8\%^\circ")—16 pages. Lists more than 2000 type designations of 26 different manufacturers arranged in alphabetical-numerical sequence; shows the RCA Direct Replacement Type or the RCA Similar Type, when available. Price 20 cents.*

**Semiconductor Devices**

- **RCA Transistors and Semiconductor Diodes**—SCD 108A (10\%^\circ" x 8\%^\circ")—82 pages. New booklet contains technical data on RCA transistors and semiconductor diodes. Includes section on transistor theory, an interchangeability directory which lists over 750 type designations of 27 different manufacturers, and a section on circuits containing 24 schematics illustrating some of the more important applications of transistors and semiconductor diodes. Price 25 cents.*

- **Technical Bulletins**—Authorized information on RCA transistors. Be sure to mention transistor-type bulletin desired. Single copy on any type free on request.

- **RCA Silicon Rectifiers**—Technical bulletin containing authorized information on silicon rectifiers of the diffused-junction type: types 1N1763 and 1N1764. Bulletin includes characteristics and performance curves. Single copy free on request.

**Components and Service Parts**

- **Service Parts Directories for RCA Victor TV Receivers**
  - SP-1007—1946-1950 (10\%^\circ" x 16\%^\circ")—80 pages. Schematic diagrams and replacement parts lists for all RCA Victor TV receivers manufactured from 1946 through June 1950 (56 models). Each schematic diagram faces its corresponding parts list for quick reference. Price 75 cents.*
  - SP-1014—1950-1951 (10\%^\circ" x 16\%^\circ")—142 pages. Schematic diagrams, replacement parts lists, and top and bottom chassis views for the 71 models of 1950 and 1951 RCA Victor TV receivers. The comprehensive index for model and chassis numbers provides a ready source of reference. Price $1.50.*
  - SP-1021—1952 (10\%^\circ" x 16\%^\circ")—36 pages. Schematic diagrams, wiring diagrams, replacement parts lists, and top and bottom chassis views for the 27 models of 1952 RCA Victor TV receivers. The comprehensive index cross-references RCA TV model names to model numbers, and model numbers to the publication in which information may be found. Price 50 cents.*
  - SP-1028—1953 (10\%^\circ" x 16\%^\circ")—84 pages. Schematic diagrams, wiring diagrams, replacement parts lists, and top and bottom chassis views for the 108 models of 1953 RCA Victor TV receivers. Also includes schematic diagrams, replacement parts, and other information for radio chassis used in radio-TV combination receivers. Cross-references model names to model numbers of all RCA TV receivers from 1946 through 1953. Cross-references all model numbers and chassis numbers to the publication in which information may be found. Price $1.35.*
  - SP-1035—1954 (10\%^\circ" x 16\%^\circ")—72 pages. Schematic diagrams, top and bottom chassis views, replacement parts

*Prices shown apply in U.S.A. and are subject to change without notice.
lists, and top and bottom chassis adjustments for the 106 models of 1954 RCA Victor TV receivers. Also included is information on the CT-100 and the 21-CT55 Color Television Receivers, and the RP-197 and RP-198 3-speed record changers. The comprehensive index references model names to model numbers of all RCA Victor TV receivers from 1946 through 1954, and all model and chassis numbers to the Service Parts Directory in which information may be found. Price $1.25.*

SP-1042—1955-1957 (10½" x 16¾")—128 pages. Schematic diagrams, top and bottom chassis views, replacement parts lists, and chassis adjustments for more than 250 models of 1955, 1956, and 1957 RCA Victor black-and-white and color TV receivers. Includes servicing information on printed circuit boards and adjustment and trouble-shooting information on the RP-205 and RP-208 record changers. Cross-references all RCA model names to model numbers, and model numbers to the publication in which information may be found. Price $2.00.*

• TV SERVICING. Bulletin TVS-1030 (10½" x 8½")—48 pages. This new booklet contains a compilation of articles on TV trouble shooting, TV tuner alignment, and TV circuit analysis by two of RCA's experts in the field of TV servicing and test equipment—John R. Meagher and Art Liebscher. Price 35 cents.*

• TV SERVICING, SUPPLEMENT 1. Bulletin TVS-1031 (10½" x 8½")—12 pages. This new booklet contains an article by John R. Meagher on solving trouble shooting problems in those hard-to-service television receivers known to service technicians as "tough" sets or "dogs." Emphasizes time-saving component-checking techniques and proper use of test equipment. Price 15 cents.*

• RCA COMPONENTS DIRECTORY FOR TV RECEIVERS—1006C (10½" x 8½")—52 pages. Lists major components of 100 different brands of TV receivers for which RCA replacement components are available. Prepared especially for service technicians and parts distributors. Easy-to-use format simplifies location of proper replacement part. Price 50 cents.*

• RCA VICTOR TV SERVICE PARTS GUIDE—SP-2001B (10½" x 8½")—16 pages. Lists stock numbers of major replacement parts for RCA Victor TV sets by receiver-model number and corresponding receiver-chassis number. Also lists stock numbers of tuner-replacement parts for individual tuner chassis. Covers period from 1946 through 1956. Price 25 cents.*

• PRACTICAL COLOR TELEVISION—Revised Edition (11" x 8½")—84 pages. Black-and-white and color illustrations. Presents comprehensive information on basic color principles, transmitted color signal, color camera, and color picture tube. Covers commercial-model receiver circuit using the RCA-15GP22 picture tube, as well as installation and service of color receivers. Provides detailed description of color-test equipment. Price $2.00.*

• PRACTICAL COLOR TELEVISION, SUPPLEMENT 1—(11" x 8½")—Contains 36 pages plus fold-out schematic and block diagrams. Describes theory, operation, and servicing of large-screen color television receiver utilizing RCA-21AXP22 color picture tube. Includes 55 black-and-white and color illustrations including schematic and block diagrams, waveforms, and explanations of color circuits and adjustments. Price 75 cents.*

• RADIO AND RECORD CHANGER SERVICE PARTS DIRECTORY—SP-1008B (8½" x 10½")—16 pages. Lists stock numbers of major replacement parts by receiver model number for all RCA Victor radios from 1954 through June 1958. Also includes stock numbers of major replacement parts for RCA phonographs, and an index cross-reference of RCA record changers to cartridge and stylus. Price 25 cents.*

• RCA PHONOGRAPH CARTRIDGE GUIDE—SP-2003B (10½" x 8½")—4 pages. Lists stock numbers of RCA cartridges and replacement stylus. Also lists stock numbers of RCA cartridges and model numbers of record players by RCA Victor model numbers. Single copy free on request.

**Batteries**

• RCA RADIO BATTERIES FOR FLASHLIGHT, RADIO, AND INDUSTRIAL APPLICATIONS

*Prices shown apply in U.S.A. and are subject to change without notice.
— BAT-134C (10½” x 8½”)—12 pages. Contains characteristics, terminal connections, and socket patterns of more than 100 RCA dry batteries for radio, flashlight, and industrial applications. Includes interchangeability directory, and a battery replacement guide for 1948 to 1957 inclusive for portable radios. Price 25 cents.

- RCA BATTERIES FOR TRANSISTOR APPLICATIONS—TBA-107 (10½” x 8½”)—16 pages. Contains technical data on 18 Le Clanche alkaline dry-cell and mercury-type dry batteries specifically designed for use in compact portable radio receivers, communications equipment, and other applications utilizing transistors. Price 15 cents.*

Test and Measuring Equipment

INSTRUCTION BOOKLETS — Illustrated instruction booklets, containing specifications, operating and maintenance data, application information, schematic diagrams, and replacement parts lists, are available for all RCA test instruments. Booklets for the following popular instruments are available at the prices indicated. Prices for booklets on other instruments are available on request.

WR-46A (Video Dot/Crosshatch Generator) .......... 1.00*  
WR-49A (RF Signal Generator) . 0.50*  
WR-49B (RF Signal Generator) . 1.00*  
WO-56A (7” Oscilloscope) .......... 0.50*  
WR-59C (TV Signal Generator) . 0.50*  
WR-61A (Color-Bar Generator) . 0.50*  
WR-61B (Color-Bar Generator) . 1.00*  
WR-69A (TV-FM Sweep Generator) .......... 1.00*  
WR-70A (RF-IF-VF Marker Adder) .......... 0.75*  
VV-77A (Junior VoltOhmst†) . 0.25*  
VV-77B (Junior VoltOhmst†) . 0.50*  
VV-77C (Junior VoltOhmst†) . 1.00*  
VV-77E (Volt Ohmst†) . 1.00*  
WO-78A (5” Oscilloscope) . 0.50*  
WO-78B (5” Oscilloscope) . 1.00*  
VV-84A (Ultra-Sensitive DC Microammeter) . 0.25*  
VV-84B (Ultra-Sensitive DC Microammeter) . 0.75*  
WR-86A (UHF Sweep Generator) . 0.50*  
VV-87A (Master VoltOhmst†) . 0.50*  
VV-87B (Master VoltOhmst†) . 0.75*  
WO-88A (5” Oscilloscope) . 0.50*  
WR-89A (Crystal-Calibrated Marker Generator) . 0.50*  
WO-91A (5” Oscilloscope) . 1.00*  
WW-97A (Senior VoltOhmst†) . 0.50*  
VV-98A (Senior VoltOhmst†) . 1.00*  
WT-100A (Electron-Tube MicroMhoMeter) . 1.75*  
WT-100A Tube Data Chart . 3.00*  
WT-110 (Automatic Electron Tube Tester) . 0.75*

*Prices shown apply in U. S. A. and are subject to change without notice.
Reading List

This list includes references of both elementary and advanced character. Obviously, the list is not inclusive, but it will guide the reader to other references.

RCA Receiving Types NOT Recommended
For New Equipment Design

Certain receiving tube types should be avoided in the design of new equipment because they are approaching obsolescence or have limited or dwindling demand. Such RCA Types are listed below. For a guide to the selection of tube types recommended for new equipment design, refer to the REceiving TUBE CLASSIFICATION CHART.

RCA Preferred Types List

A list of preferred tube types is available to assist equipment designers and manufacturers in formulating their plans for future production of electronic equipment. This list is based on periodic surveys of the needs of the engineering and manufacturing fields and keeps abreast of technological advances in tube design and application.

A copy of the current list will be gladly furnished on request. Write to Commercial Engineering, Electron Tube Division, Radio Corporation of America, Harrison, N. J.
